1 Introduction and Functional Overview

This specification specifies the functionality, API and the configuration of the software module Crypto Service Manager (CSM) to satisfy the top-level requirements represented in the CSM Requirements Specification (SRS) [CSM_SRS].

The CSM shall provide synchronous or asynchronous services to enable a unique access to basic cryptographic functionalities for all software modules. The CSM shall provide an abstraction layer, which offers a standardized interface to higher software layers to access these functionalities.

The functionality required by a software module can be different to the functionality required by other software modules. For this reason, there shall be the possibility to configure and initialize the services provided by the CSM individually for each software module. This configuration comprises as well the selection of synchronous or asynchronous processing of the CSM services.

The construction of the CSM module follows a generic approach. Wherever a detailed specification of structures and interfaces would limit the scope of the usability of the CSM, interfaces and structures are defined in a generic way. This provides an opportunity for future extensions.

2 Acronyms and Abbreviations

Acronyms and abbreviations, which have a local scope and therefore are not contained in the AUTOSAR glossary [13], are listed in this chapter.

Abbreviation / Acronym:	Description:
AEAD	Authenticated Encryption with Associated Data
CDD	Complex Device Driver
CSM	Crypto Service Manager
CRYIF	Crypto Interface
CRYPTO	Crypto Driver
DET	Default Error Tracer
HSM	Hardware Security Module
HW	Hardware
SHE	Security Hardware Extension
SW	Software

2.1 Glossary of Terms

Terms:	Description:
Crypto Driver Object	A Crypto Driver implements one or more Crypto Driver Objects. The Crypto Driver Object can offer different crypto primitives in hardware or software. The Crypto Driver Objects of one Crypto Driver are independent of each other. There is only one workspace for each Crypto Driver Object (i.e. only one crypto primitive can be performed at the same time)
Key	A Key can be referenced by a job in the Csm. In the Crypto Driver, the key refers a specific key type.
Key Type	A key type consists of refers to key elements. The key types are typically pre-configured by the vendor of the Crypto Driver.
Key Element	Key elements are used to store data. This data can be e.g. key material or the IV needed for AES encryption. It can also be used to configure the behaviour of the key management functions.
Job	A Job is a configured 'CsmJob'. Among others, it refers to a key, a cryptographic primitive and a reference channel.
Channel	A channel is the path from a Crypto Service Manager queue via the Crypto Interface to a specific Crypto Driver Object.
Primitive	A primitive is an instance of a configured cryptographic algorithm realized in a Crypto Driver Object. Among others it refers to a functionality provided by the CSM to the application, the concrete underlining 'algorithmfamily' (e.g. AES, MD5, RSA, etc.), and a 'algorithmmode' (e.g. ECB, CBC, etc).

Operation	An operation of a crypto primitive declares what part of the crypto primitive shall be performed. There are three different operations:	
	START	Operation indicates a new request of a crypto primitive, it shall cancel all previous requests perform necessary initializations and checks if the crypto primitive can be processed.
	UPDATE	Operation indicates, that the crypto primitive expect input data. An update operation may provide intermediate results.
	FINISH	Operation indicates, that after this part all data are fed completely and the crypto primitive can finalize the calculations. A finish operation may provide final results.
It is also possible to perform more than one operation at once by concatenating the corresponding bits of the operation_mode argument.		
Priority	The priority of a job defines the importance of it. The higher the priority (as well in value), the more immediate the job will be executed. The priority of a cryptographic job is part of the configuration.	
Processing	Indicates the kind of job processing.	
	Asynchronous	The job is not processed immediately when calling a corresponding function. Usually, the caller is informed via a callback function when the job has been finished.
	Synchronous	The job is processed immediately when calling a corresponding function. When the function returns, a result will be available.
Service	A service shall be understand as defined in the TR_Glossary document: A service is a type of operation that has a published specification of interface and behavior, involving a contract between the provider of the capability and the potential clients.

3.3 Related specification

AUTOSAR provides a General Specification on Basic Software modules (SWS BSW General), which is also valid for Crypto Service Manager.

Thus, the specification SWS BSW General shall be considered as additional and required specification for Crypto Service Manager.

4 Constraints and Assumptions

4.1 Limitations

Some type definitions of CSM start with the Prefix “CRYPTO_” which will violate SRS_BSW_00305. This will be harmonized in release 4.3.1. Nevertheless due to the constraint [constr_1050] part 1 the ports are still consider to be compatible.

4.2 Applicability to Car Domains

n.a.

4.3 Security Implications

There is no user management in place, which prevents non-authorized access on any of CSM’s services. This means, that if any access protection is needed such must be implemented by the application and the served (by CSM) cryptographic library modules; access protection is not target of the CSM.

5 Dependencies to other Modules

[SWS_Csm_00001] [The CSM shall be able to access the cryptographic interface (CRYIF), which is implemented according to the cryptographic interface specification.]
(SRS_CryptoStack_00082)

[SWS_Csm_00506] [The CSM module shall use the interfaces of the CRYIF with the underlying Crypto Drivers (CRYPTO) to calculate the result of a cryptographic service.]

(SRS_CryptoStack_00082)

The incorporated cryptographic library modules or hardware extensions of the Crypto Driver provide the cryptographic routines, e.g. SHA-1, RSA, AES, Diffie-Hellman key-exchange, etc.

6 Requirements Traceability

Requirement	Description	Satisfied by
SRS_BSW_00101	The Basic Software Module shall be able to initialize variables and hardware in a separate initialization function	SWS_Csm_00646
SRS_BSW_00358	The return type of init() functions implemented by AUTOSAR Basic Software Modules shall be void	SWS_Csm_00646
SRS_BSW_00359	All AUTOSAR Basic Software Modules callback functions shall avoid return types other than void if possible	SWS_Csm_00970, SWS_Csm_00971
SRS_BSW_00360	AUTOSAR Basic Software Modules callback functions are allowed to have parameters	SWS_Csm_00970, SWS_Csm_00971
SRS_BSW_00373	The main processing function of each AUTOSAR Basic Software Module shall be named according the defined convention	SWS_Csm_00479
SRS_BSW_00407	Each BSW module shall provide a function to read out the version information of a dedicated module implementation	SWS_Csm_00705
SRS_BSW_00414	Init functions shall have a pointer to a configuration structure as single parameter	SWS_Csm_00646
SRS_BSW_00432	Modules should have separate main processing functions for read/receive and write/transmit data path	SWS_Csm_00479
SRS_CryptoStack_00008	The Crypto Stack shall allow static configuration of keys used for cryptographic jobs	SWS_Csm_00951, SWS_Csm_00953, SWS_Csm_01012, SWS_Csm_01092
SRS_CryptoStack_00009	The Crypto Stack shall support reentrancy for all crypto services	SWS_Csm_00022
SRS_CryptoStack_00010	The Crypto Stack shall conceal symmetric keys from the users of crypto services	SWS_Csm_00959
SRS_CryptoStack_00011	The Crypto Stack shall conceal asymmetric private keys from the users of Crypto services	SWS_Csm_00959
SRS_CryptoStack_00019	The Crypto Stack shall identify random number generation as	SWS_Csm_01543

	a cryptographic primitive which can be requested to a driver	
SRS_CryptoStack_00020	The Crypto Stack shall identify symmetric encryption/decryption as a cryptographic primitive which can be requested to a driver	SWS_Csm_00984, SWS_Csm_00989
SRS_CryptoStack_00021	The Crypto Stack shall identify asymmetric encryption/decryption as a cryptographic primitive which can be requested to a driver	SWS_Csm_00984, SWS_Csm_00989
SRS_CryptoStack_00022	The Crypto Stack shall identify MAC generation/verification as a cryptographic primitive which can be requested to a driver	SWS_Csm_00982
SRS_CryptoStack_00023	The Crypto Stack shall identify asymmetric signature generation/verification as a cryptographic primitive which can be requested to a driver	SWS_Csm_00992, SWS_Csm_00996
SRS_CryptoStack_00024	The Crypto Stack shall identify hash calculation as a cryptographic primitive which can be requested to a driver	SWS_Csm_00980
SRS_CryptoStack_00026	The Crypto Stack shall provide an interface for the generation of asymmetric keys	SWS_Csm_00955
SRS_CryptoStack_00027	The Crypto Stack shall provide an interface for the generation of symmetric keys	SWS_Csm_00955
SRS_CryptoStack_00082	The CSM module specification shall specify the interface and behavior of the callback function, if the asynchronous job processing mode is selected	SWS_Csm_00001, SWS_Csm_00032, SWS_Csm_00506
SRS_CryptoStack_00084	The CSM module shall use the streaming approach for some selected services	SWS_Csm_01039
SRS_CryptoStack_00086	The CSM module shall distinguish between error types	SWS_Csm_01089, SWS_Csm_91004
SRS_CryptoStack_00087	The CSM module shall report detected development errors to the Default Error Tracer	SWS_Csm_01088, SWS_Csm_01091
SRS_CryptoStack_00090	The CSM shall provide an interface to be accessible via the RTE	SWS_Csm_00802, SWS_Csm_00803, SWS_Csm_00902, SWS_Csm_00903, SWS_Csm_00912, SWS_Csm_00922, SWS_Csm_00923, SWS_Csm_00927, SWS_Csm_00928, SWS_Csm_00930,

		SWS_Csm_00934, SWS_Csm_00935, SWS_Csm_00936, SWS_Csm_00943, SWS_Csm_00946, SWS_Csm_01042, SWS_Csm_01074, SWS_Csm_01075, SWS_Csm_01077, SWS_Csm_01078, SWS_Csm_01079, SWS_Csm_01906, SWS_Csm_01910, SWS_Csm_01915, SWS_Csm_01920, SWS_Csm_01921, SWS_Csm_01922, SWS_Csm_01923, SWS_Csm_01924, SWS_Csm_01925, SWS_Csm_01926, SWS_Csm_01927, SWS_Csm_01928, SWS_Csm_09000, SWS_Csm_91023, SWS_Csm_91045, SWS_Csm_91046, SWS_Csm_91051, SWS_Csm_91052, SWS_Csm_91053, SWS_Csm_91054, SWS_Csm_91055, SWS_Csm_91056, SWS_Csm_91057, SWS_Csm_91058, SWS_Csm_91059, SWS_Csm_91060, SWS_Csm_91062, SWS_Csm_91105
SRS_CryptoStack_00091	The CSM shall provide one Provide--Port for each configuration	SWS_Csm_00934, SWS_Csm_01042, SWS_Csm_91023, SWS_Csm_91062
SRS_CryptoStack_00095	The Crypto Driver module shall strictly separate error and status information	SWS_Csm_91043, SWS_Csm_91044

7 Functional specification

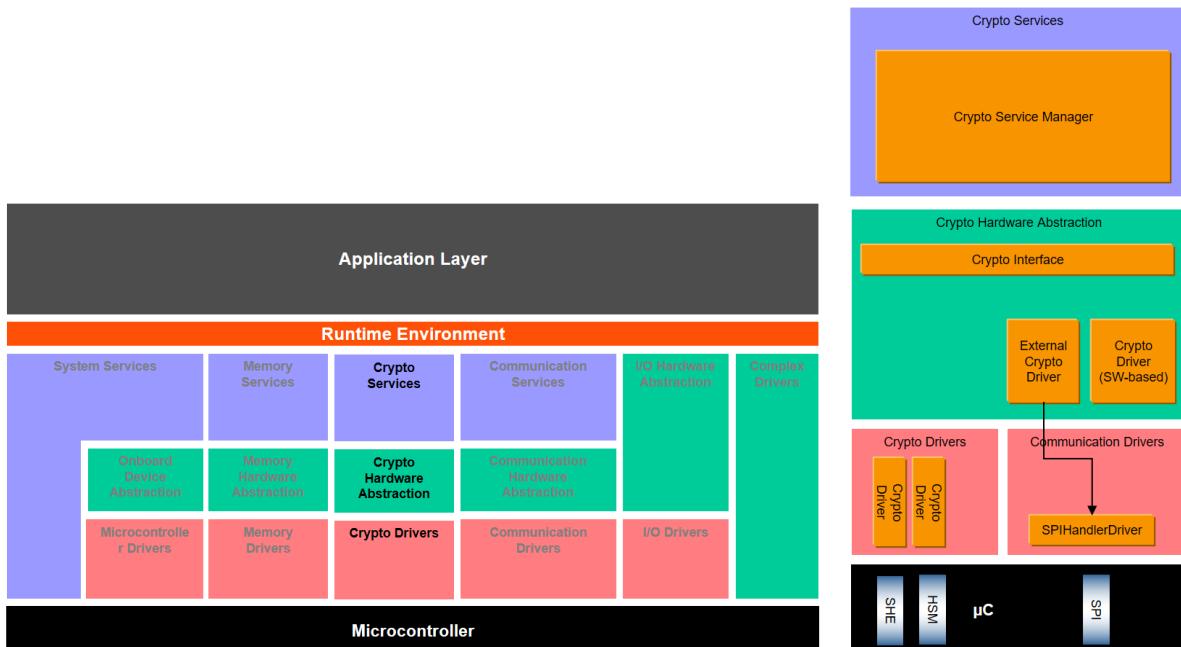

Figure 7-1 AUTOSAR Layered View with CSM

7.1 Basic Architecture Guidelines

The starting point for the description of the design of the CSM module is the AUTOSAR Layered Software Architecture (see Figure 7-1). The description of the CSM module architecture on the basis of the AUTOSAR layered software architecture shall help to understand the specification of interfaces and functionalities of the CSM module in the following sections.

The architecture of AUTOSAR consists of several layers which can be seen in Figure 7-1. The Service Layer is the highest layer of the Basic Software. Its task is to provide basic services for application and basic software modules, i.e. it offers the most relevant functionalities for application software and basic software modules.

CSM is a service that provides cryptography functionality, based on a crypto driver which relies on a software library or on a hardware module. Also, mixed setups with multiple crypto drivers are possible. The CSM accesses the different CryptoDrivers over the CRYIF.

The CSM, as a service layer, provides the interface for SW-C or BSW for cryptographic operations. The main task of the CSM is to schedule and prioritize services and to call the crypto interface (CryIf) for further operation. The CryIf schedules the requests to the crypto driver and its crypto driver object that was statically assigned to this service.

The CSM uses a static configuration of primitives (CsmPrimitives) to define a cryptographic operation. Such a primitive is then assigned to a job configuration (CsmJob) that determines further attributes like priority, asynchronous or synchronous execution and what key shall be used for the operation. It should be

noted that the key is always located in the crypto driver itself and the CSM uses only a reference to it.

The separation of the keys and primitives allows to separate the API for the cryptographic operation and the key management. This allows to let an application concentrate on the required cryptographic operation like MAC calculation and verification whereas a key manager provides the keys during a configuration setup. The API of the CSM can roughly be divided into two categories: a direct API (mainly for key management) and a job-based API (mainly for cryptographic operations) (see Fig. x)¹. The direct API has a direct correspondence of the functions in the Crylf and the Crypto Driver. These functions can only be called synchronously. The CSM will pass the parameter from the application directly to the function call. The job-based API uses a job structure, the Crypto_JobType, that contains static and dynamic parameters and references to structures to provide all necessary information to the crypto driver to perform that job (see Fig. x+1). Every service that uses a job will use this structure. All necessary parameter for a service will be packed into the elements of the structure by the CSM and will then call the Crylf and this, in turn, will call the configured Crypto Driver.

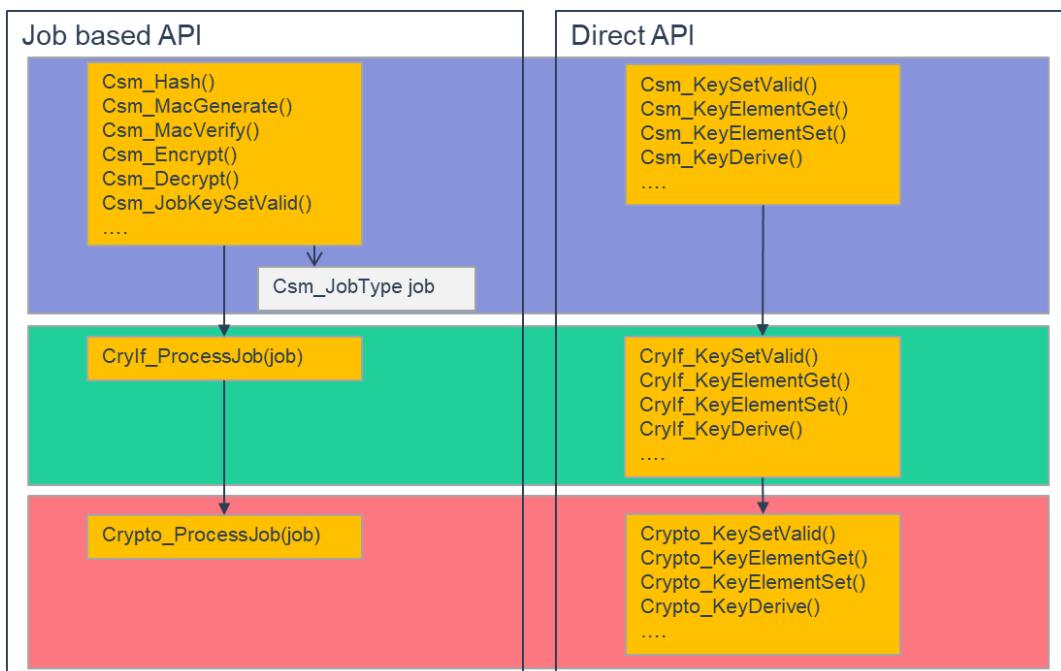

Figure 7-2 API call tree for CSM, Crylf and Crypto. Divided into job-based API and Direct API

A job can run synchronously or asynchronously depending on the static configuration. The parameters for crypto service info, crypto algorithm family and mode determine the exact cryptographic algorithm that shall be performed in the crypto driver.

¹ Historically, there are a few functions with direct synchronous API and a job based API, because the need for asynchronous execution was recognized afterwards.

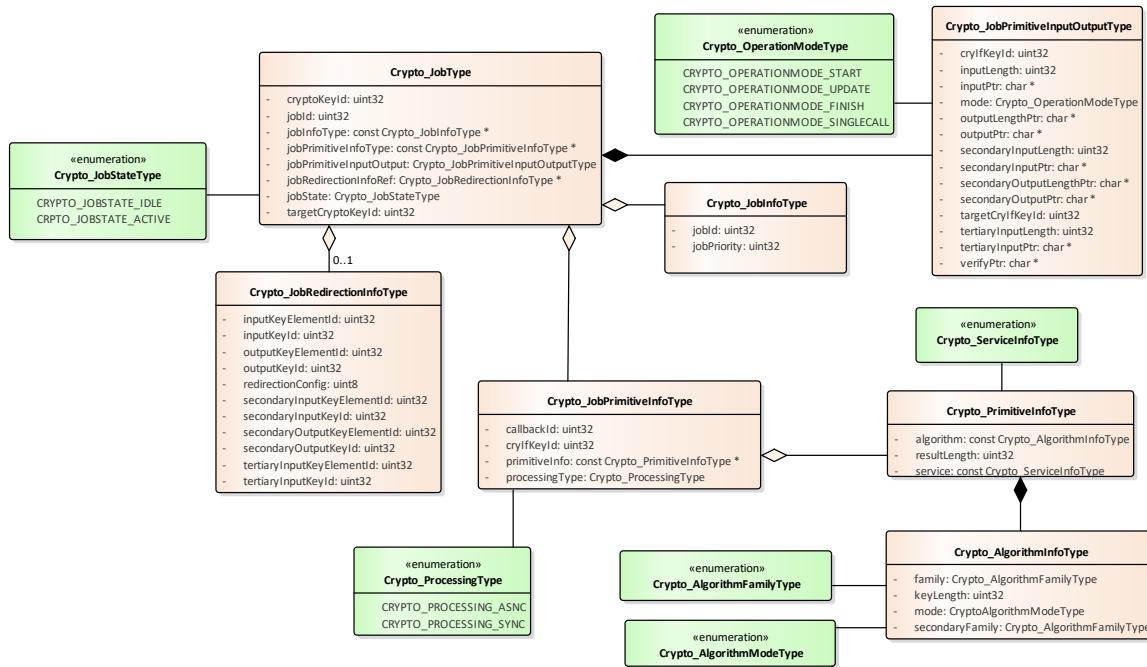

Figure 7-3 Structure of **Crypto_JobType** (Job) and its dependencies

]

[SWS_Csm_00942] [If any of the SWS items *Csm[CsmPrimitives]AlgorithmFamily*, *Csm[CsmPrimitives]AlgorithmMode* and/or *Csm[CsmPrimitives]SecondaryAlgorithmFamily* in the container *Csm[CsmPrimitives]Config* is set to *CRYPTO_ALGOFAM_CUSTOM* (0xFF) resp. *CRYPTO_ALGOMODE_CUSTOM* (0xFF), then the value of the reference to *CryptoPrimitiveAlgorithmFamilyCustom/CryptoPrimitiveAlgorithmFamilyCustomId* and/or *CryptoPrimitiveAlgorithmModeCustom/CryptoPrimitiveAlgorithmModeCustomId* defined in the Crypto Driver shall be set to either of the fields “family”, “mode” and/or “secondaryFamily” in *Crypto_AlgorithmInfoType* (instead of the “CUSTOM” value 0xff itself).
]()

7.2 General Behavior

[SWS_Csm_00941] [A job is an instance of a configured cryptographic primitive.
]()

[SWS_Csm_00016] [For each job just one instance shall be processed by CSM at a time.
]()

[SWS_Csm_00022] [The CSM module shall allow parallel processing of different jobs.

] (SRS_CryptoStack_00009)

[SWS_Csm_00017] [If a service of the CSM module is requested and the corresponding job is in "ACTIVE" state, the job request shall call CryIf_ProcessJob() and pass on the return value.
]()

[SWS_Csm_00018] [If a service of the CSM module is requested, and the CSM job needs to be queued and the queue is full, the job request shall be rejected with the return value CRYPTO_E_BUSY.
]()

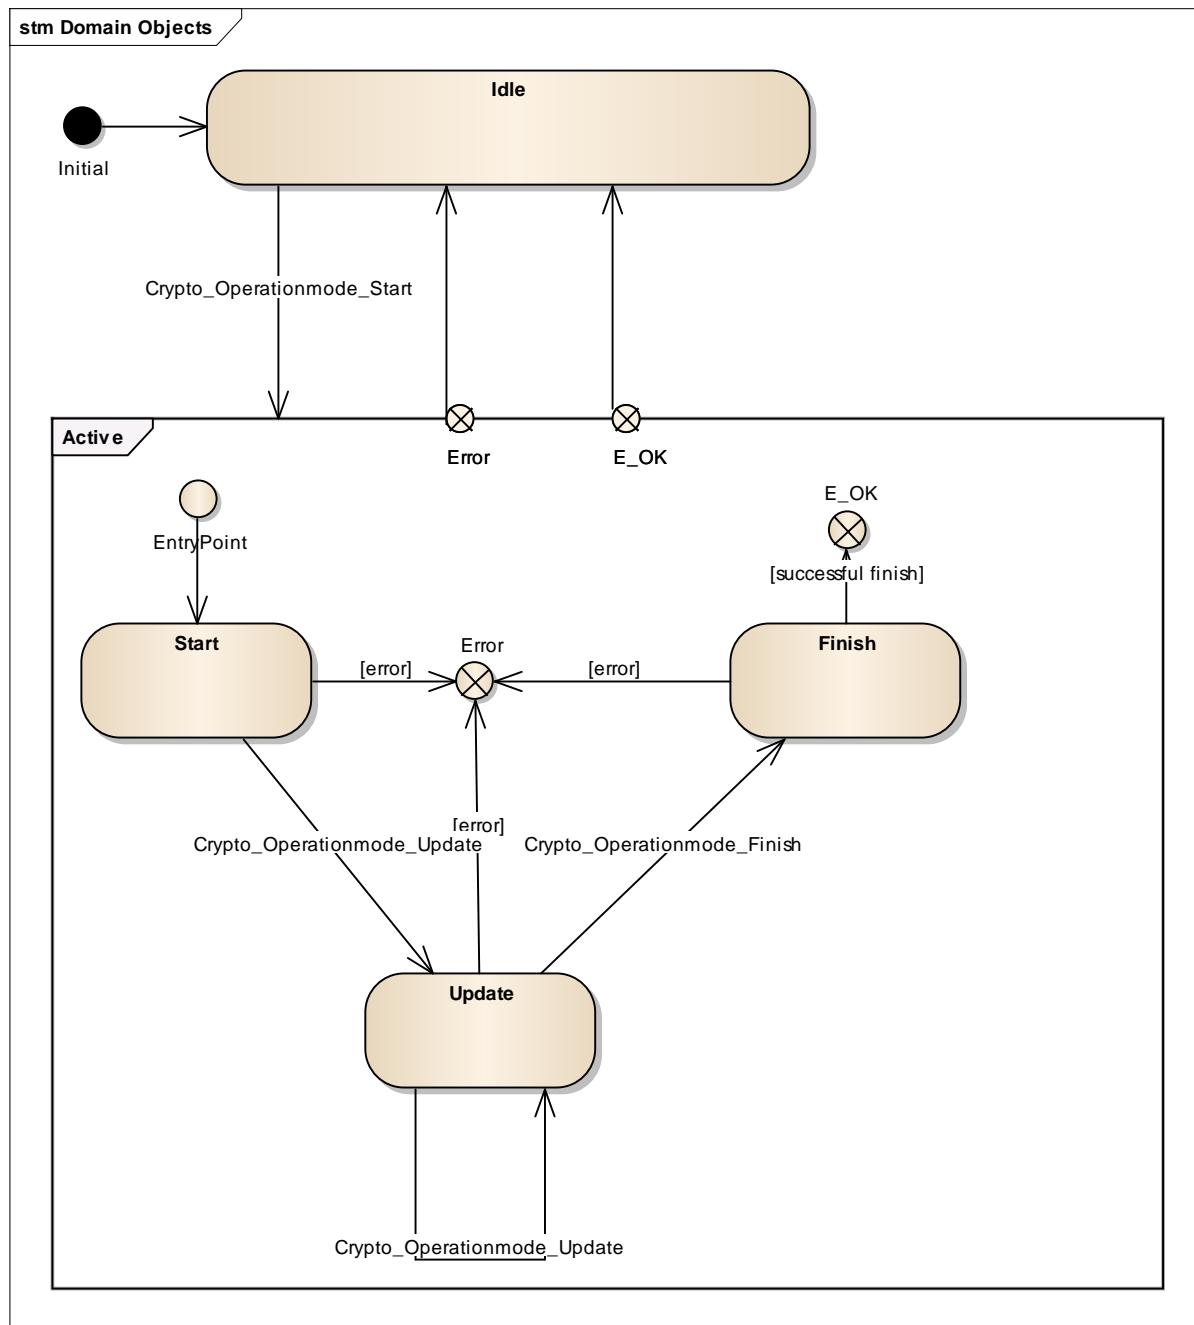

[SWS_Csm_00019] [If an asynchronous interface is configured, the CSM module shall provide a main function Csm_MainFunction() which is called cyclically to control processing of the jobs via a state machine.
]()

7.2.1 Normal Operation

[SWS_Csm_01039] [To unite a single call function and the streaming approach for the crypto services, there is the mode parameter, which determines the operation mode. This service operation is a flag field, indicating the operation mode "START", "UPDATE" or "FINISH". It declares explicitly what operation shall be performed. These operation modes can be mixed, and execute multiple operations at once. The diagram in **SWS_Csm_00024** shows the state machine of a job of this design.
] (SRS_CryptoStack_00084)

Note: The actual transaction of the states is made in the layer, which works with these states, i.e. in the Crypto Driver.

[SWS_Csm_00024] [

]()

[SWS_Csm_01033] The CSM crypto services shall support to process multiple operation mode inputs with a single call.

]()

[SWS_Csm_01045] If the CRYPTO_OPERATIONMODE_START and CRYPTO_OPERATIONMODE_FINISH bits are set and the CRYPTO_OPERATIONMODE_UPDATE is not set, the `Csm_<Service>()` function shall return with E_NOT_OK.

]()

Note: The coherent single call approach could improve the performance due to less overhead. Instead of calling the explicit API multiple times, only one call is necessary. This approach is intended to be used with small data input, which demand fast processing.

While operating with the streaming approach (“Start”, “Update”, “Finish”) the dedicated Crypto Driver Object is waiting for further input (“Update”) until the “Finish” state has been reached. No other job could be processed on this Crypto Driver instance meanwhile.

7.2.1.1 Configuration

[SWS_Csm_91005] [Each crypto primitive configuration shall be realized as a constant structure of type `Crypto_PrimitiveInfoType`.

]()

[SWS_Csm_91006] [Each job primitive configuration shall be realized as a constant structure of type `Crypto_JobPrimitiveInfoType`.

]()

[SWS_Csm_00028] [It shall be possible to create several configurations for each cryptographic primitive.

]()

One configuration per job per primitive is possible.

[SWS_Csm_00029] [When creating a primitive configuration, it shall be possible to configure all available and allowed schemes from the underlying Crypto Driver Object.

]()

[SWS_Csm_00032] [If the asynchronous interface is chosen, each job primitive configuration shall contain a callback function.

] (SRS_CryptoStack_00082)

7.2.1.2 Synchronous Job Processing

[SWS_Csm_00035] [When the synchronous interface is used, the interface functions shall immediately compute the result with the help of the underlying Crypto Stack modules.

]()

[SWS_Csm_00037] [If a synchronous job is issued and the priority is greater than the highest priority available in the queue, the CSM shall disable processing new jobs from the queue until the next call of the main function has finished that follows after completion of the currently processed job.

]()

Note:

Channels may hold jobs of both asynchronous and synchronous processing type. If

so, a synchronous job might not be accepted for processing although its job's priority is higher than those of all asynchronous jobs.

Note:

As the underlying Crypto Driver can have its own queue, it can not always be ensured that the highest priority job provided by the application is processed next.

[SWS_Csm_91007] | If a synchronous job is issued and the priority is less than the highest priority available in the queue, the CSM shall return `CRYPTO_E_BUSY`.

]()

Note:

By pausing calls to the CSM main function with e.g. critical sections during calling the synchronous jobs, it can be ensured, that synchronous jobs can be processed in a row without having to wait for asynchronous jobs in between if they have a high enough priority. Also consider disabling queueing in the Crypto Driver Object to ensure fast processing of synchronous jobs.

If the loading of asynchronous jobs from the queue shall not be paused by synchronous jobs, the priorities of the synchronous jobs have to be smaller than the asynchronous jobs.

7.2.1.3 Asynchronous Job Processing

[SWS_Csm_00036] | If the asynchronous interface is used, the interface functions shall only hand over the necessary information to the underlying Crypto Stack modules.

]()

[SWS_Csm_00039] | The users of the CSM shall be notified when a requested cryptographic service has been processed by calling the callback function from the job primitive configuration.

]()

7.2.2 Design Notes

The CSM provides two services: (1) the crypto services itself and (2) key management.

7.2.2.1 CSM module startup

The `Csm_Init()` request shall not be responsible to trigger the initialization of the underlying CRYIF. It is assumed, that the underlying CRYIF will be initialized by any appropriate entity (e.g. BswM).

Software components, which are using the CSM module, shall be responsible for checking global error and status information resulting from the CSM module startup.

7.2.2.2 Crypto Services

7.2.2.2.1 Usage of the CSM crypto services

[**SWS_Csm_00734**] [CSM crypto services shall provide a `Csm_<Service>()` API.]()

[**SWS_Csm_00924**] [The application shall be able to call `Csm_<Service>()` with the operation mode `CRYPTO_OPERATIONMODE_START` to initialize cryptographic computations.]()

[**SWS_Csm_00925**] [The application shall be able to call `Csm_<Service>()` with the operation mode `CRYPTO_OPERATIONMODE_UPDATE` arbitrary often, but at least one time, to feed the job's crypto primitive with input data.]()

[**SWS_Csm_01046**] [The application shall be able to call `Csm_<Service>()` with the operation mode `CRYPTO_OPERATIONMODE_FINISH` to finalize cryptographic computations.]()

[**SWS_Csm_01055**] [Only the service operations HASH, MACGENERATE, MACVERIFY, ENCRYPT, DECRYPT, AEAD_ENCRYPT, AEAD_DECRYPT, SIGNATUREGENERATE, SIGNATUREVERIFY shall support the operation mode START, UPDATE and FINISH as specified from the API. For all other service operations, the CSM shall set the operation mode to CRYPTO_OPERATIONMODE_SINGLECALL, even if the API does not provide an operation mode.]()

Note:

The `Csm_<Service>()` will call the `CryIf_ProcessJob()` with a pointer to `Crypto_JobType`, where all the necessary information are stored to process the job.

Part of this `Crypto_JobType` is a `Crypto_JobPrimitiveInputOutputType`, where all the information about the input and output parameters depending of the service are stored. A definition of the mapping from the API parameters of `Csm_<Service>()` to the parameters of `Crypto_JobPrimitiveInputOutputType`, can be found in [**SWS_Crypto_00073**] of the Crypto Driver specification.

[**SWS_Csm_01093**] [If the CSM issues either the service `CRYPTO_MACGENERATE`, `CRYPTO_MACVERIFY`, `CRYPTO_ENCRYPT`, `CRYPTO_DECRYPT`, `CRYPTO_AEADENCRYPT`, `CRYPTO_AEADDECRYPT`, `CRYPTO_RANDOMGENERATE`, `CRYPTO_SIGNATUREGENERATE` or `CRYPTO_SIGNATUREVERIFY` to the Crypto Interface, it needs to make sure that the element `jobPrimitiveInfo->cryIfKeyId` in the job structure of `Crypto_JobType` references to the assigned key of this job.]()

J()

Note: The CryIf is responsible to transform this ID to the corresponding key ID of the respective crypto driver.

[SWS_Csm_01094] If one of the primitive services CRYPTO_KEYSETVALID, CRYPTO_KEYSETINVALID, CRYPTO_RANDOMSEED, CRYPTO_KEYGENERATE, CRYPTO_KEYDERIVE, CRYPTO_KEYEXCHANGECALCPUBVAL or CRYPTO_KEYEXCHANGECALCSECRET are to be executed, the CSM shall fill in the elements of the structure Csm_JobType->jobPrimitiveInputOutput->cryIfKeyId and, if applicable, Csm_JobType->jobPrimitiveInputOutput->targetCryIfKeyId with the corresponding CryIf key ID.

J()

Note: The CryIf is responsible to transform these IDs to the corresponding key IDs of the respective crypto driver.

7.2.2.2.2 Queuing

The CSM may have several queues, where the jobs are lining up depending on their priority, to process multiple cryptographic requests. The path from a CSM queue via the CryIf to a Crypto Driver Object is called a *channel*. Each queue of the CSM is mapped to one channel to access the crypto primitives of the Crypto Driver Object. The size of the queue is configurable.

To optimize the hardware usage of the Crypto Driver Object, there is optionally a queue in Crypto Driver, too.

A Crypto Driver Object represents an instance of an independent crypto “device” (hardware or software, e.g. AES accelerator). There could be a channel for fast AES and CMAC calculations on an HSM for jobs with high priority, which ends on a native AES calculation service in the Crypto Driver. But it is also possible, that a Crypto Driver Object is a piece of software, e.g. for RSA calculations where users are able to encrypt, decrypt, sign or verify data.

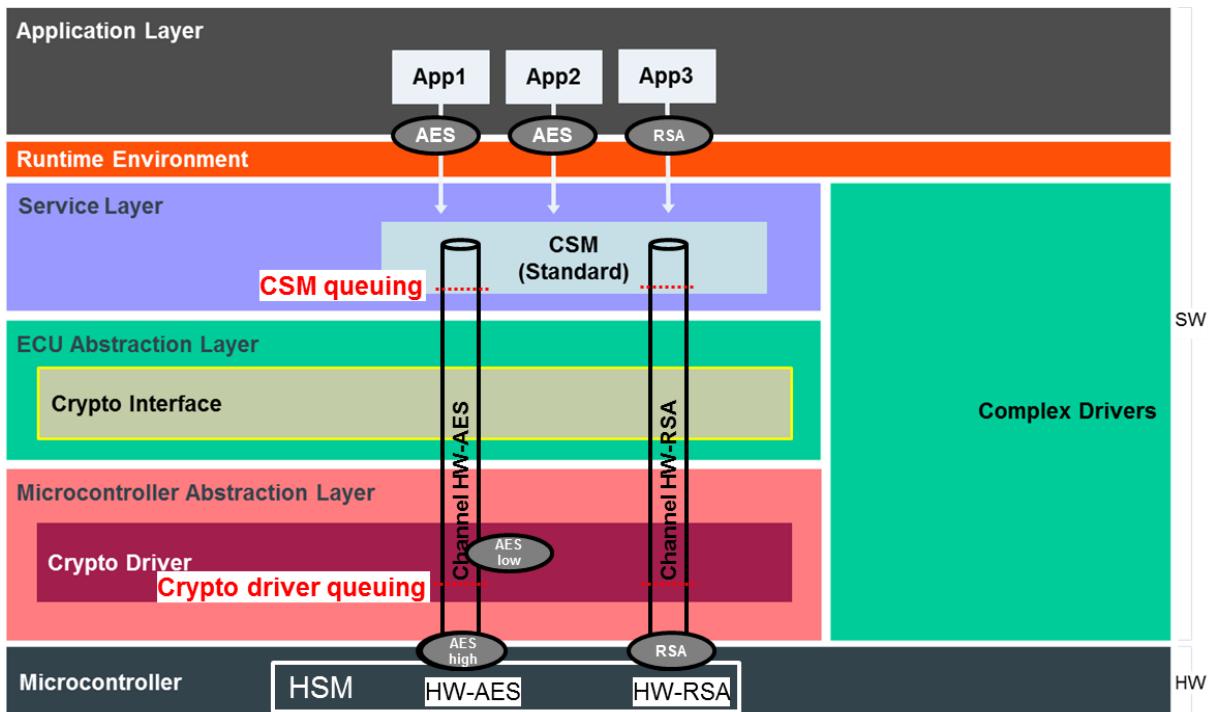

Figure 7-4 AUTOSAR Layered View with channels

Figure 7-4 illustrates an AUTOSAR Layered View with channels. In this example, there is a HSM with two Crypto Driver Objects (HW-AES and HW-RSA), each of them has an own channel. Each channel is connected to a CSM queue and a Crypto Driver Object queue.

In this case, both Crypto Driver Objects are processing a crypto job (AES-high and RSA) each, while the queue of the Crypto Driver Object contains one more job (AES-low). If the HW-AES of the HSM finished the AES-high job, AES-low job will be processed as next one.

Other scenarios with the same setup (without jobs in process or in queues) can be derived as follows:

It will be assumed, that a new job of an application calls RSA.

- If the Crypto Driver Object of the RSA is not busy, the job will be processed immediately.
- If the Crypto Driver Object of the RSA is busy, but the queue of the Crypto Driver Object is not full, the job will be listed into that queue in order of its priority. As soon as the Crypto Driver Object is free, the job with the highest priority from the Crypto Driver Object queue will be executed.
- If the Crypto Driver Object of the RSA is busy and the queue of the Crypto Driver Object is full, the job will be stored in the CSM queue in order of its priority.
- If the Crypto Driver Object of the RSA is busy and the queue of the Crypto Driver Object as well as the CSM queue are full, the CSM rejects the request.
- If the Crypto Driver Object of the RSA is active, the job is already started in the Crypto Driver and is waiting for either more data to process or the finish command.

[SWS_Csm_00940] [It shall be possible to queue CSM jobs in configured CsmQueues in the CSM.

]()

[SWS_Csm_00944] [The CsmQueues shall sort the jobs according to the configured job's priority.

]()

The higher the job priority value, the higher the job's priority.

[SWS_Csm_91072] [A service operation shall only be added to the queue if the data consistency of the job structure can be guaranteed. This shall be particularly considered when services with the same jobID are added to the queue (e.g. with subsequent calls to `Csm_SignatureVerify()` and `Csm_SaveContextJob()`). If this cannot be guaranteed, the service operation shall return with `E_BUSY`.

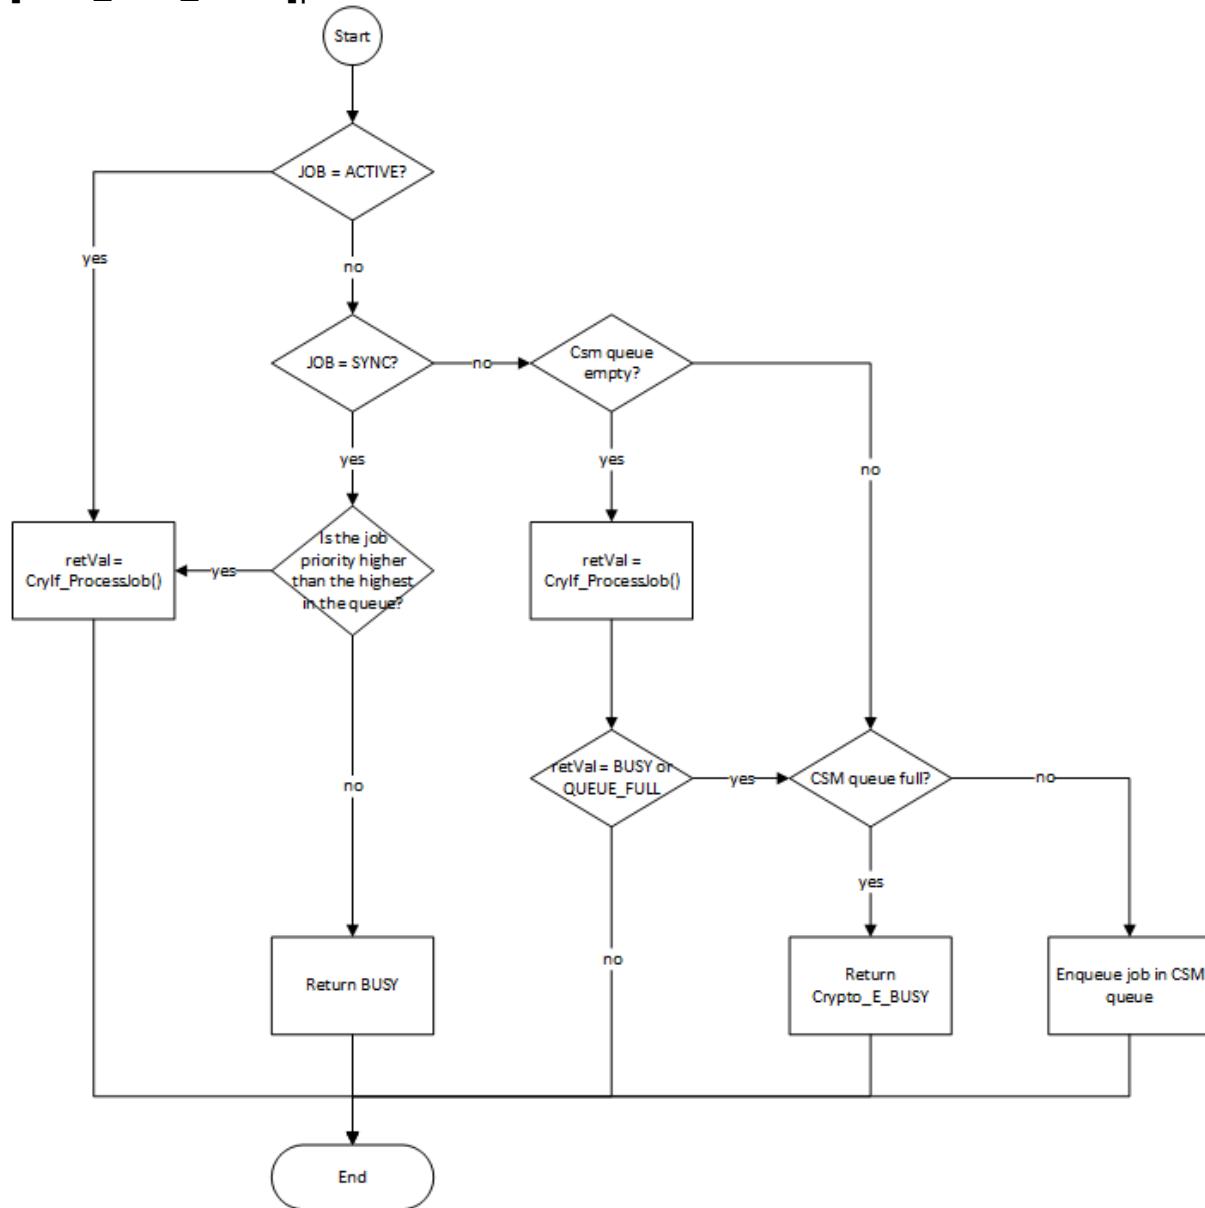

]()

[SWS_Csm_91073] [] If services with the same JobID can be added to the queue, then the order of execution of these services shall correspond to the order of incoming services operation requests (“First-In-First-Out”).

]()

[SWS_Csm_91074] [The `Csm_<Service>()` function shall behave as shown in diagram SWS_Csm_01041.

]()

[SWS_Csm_01041]

]()

Synchronous job processing and queuing might not be useful. So, if synchronous job processing is chosen, the queue sizes should be “0”. However, it is also possible to use channels (including queues) with synchronous and asynchronous jobs.

The queued jobs can be passed to the CRYIF in the `Csm_MainFunction()`.

If the job has the state “active” the CSM shall assume, that the mapped cryptographic driver instance is currently processing this job and the caller wants to continue with the operation (e.g. feeding more data using “update”). The plausibility check has to be performed in the cryptographic driver instance.

7.2.2.3 Key Management

[SWS_Csm_00950] [Services belonging to the key management shall provide the Csm_<Service>() function, only.]()

[SWS_Csm_00954] [A key consists of one or more key elements.]()

Examples of key elements are the key material itself, an initialization vector, a seed for random number generation, or the proof of the SHE standard.

Keys, i.e. the corresponding key IDs have symbolic names given by the configuration. The Crypto Stack API uses the following key element index definition from the CSM module:

[SWS_Csm_01022] [

Crypto Service:	key element:	key element Name:	key element ID:
MAC	Key Material	CRYPTO_KE_MAC_KEY	1
	Proof (SHE)	CRYPTO_KE_MAC_PROOF	2
	Seed	CRYPTO_KE_KEYGENERATE_SEED	16
Signature	Key Material	CRYPTO_KE_SIGNATURE_KEY	1
	ECC curve type	CRYPTO_KE_SIGNATURE_CURVETYPE	29
Random	Seed State	CRYPTO_KE_RANDOM_SEED_STATE	3
	Algorithm	CRYPTO_KE_RANDOM_ALGORITHM	4
Cipher/AEAD	Key Material	CRYPTO_KE_CIPHER_KEY	1
	Init Vector	CRYPTO_KE_CIPHER_IV	5
	Proof (SHE)	CRYPTO_KE_CIPHER_PROOF	6
	2 nd Key Material	CRYPTO_KE_CIPHER_2NDKEY	7
Key Exchange	Base	CRYPTO_KE_KEYEXCHANGE_BASE	8
	Private Key	CRYPTO_KE_KEYEXCHANGE_PRIVKEY	9
	Own Public Key	CRYPTO_KE_KEYEXCHANGE_OWNPUBKEY	10
	Shared Value	CRYPTO_KE_KEYEXCHANGE_SHAREDVALUE	1
	Algorithm	CRYPTO_KE_KEYEXCHANGE_ALGORITHM	12
	ECC curve type	CRYPTO_KE_KEYEXCHANGE_CURVETYPE	29
Key Derivation	Password	CRYPTO_KE_KEYDERIVATION_PASSWORD	1
	Salt	CRYPTO_KE_KEYDERIVATION_SALT	13
	Iterations	CRYPTO_KE_KEYDERIVATION_ITERATIONS	14

	Algorithm	CRYPTO_KE_KEYDERIVATION_ALGORITHM	15
	ECC curve type	CRYPTO_KE_KEYDERIVATION_CURVETYPE	29
Key Generate	Key Material	CRYPTO_KE_KEYGENERATE_KEY	1
	Seed	CRYPTO_KE_KEYGENERATE_SEED	16
	Algorithm	CRYPTO_KE_KEYGENERATE_ALGORITHM	17
	ECC curve type	CRYPTO_KE_KEYGENERATE_CURVETYPE	29

]()

The key elements indices of **SWS_Csm_1022** can be extended by the vendor.

[SWS_Csm_00951] [For each key element that contains cryptographic key material, the format of the provided key shall be specified in the configuration used for data exchange, e.g. for `Csm_KeyElementGet()` or `Csm_KeyElementSet()`. The key formats supported by a specific crypto driver are part of the pre-configuration information that comes along with the crypto driver.]

(SRS_CryptoStack_00008)

[SWS_Csm_00953] [The following key formats are available:

CRYPTO_KE_FORMAT_BIN_OCTET	Key provided as octet value in binary form ¹ .
CRYPTO_KE_FORMAT_BIN_SHEKEYS	Combined input/output keys for SHE operation (M1+M2+M3) and (M4+M5).
CRYPTO_KE_FORMAT_BIN_IDENT_PRIVATEKEY_PKCS8	Private key material in ASN.1 coded form (BER coding) with identification. The data is provided in binary form, not, e.g. as a BASE64 string.
CRYPTO_KE_FORMAT_BIN_IDENT_PUBLICKEY	Public key material in ASN.1 coded form (BER coding) with identification. The data is provided in binary form, not, e.g. as a BASE64 string.
CRYPTO_KE_FORMAT_BIN_RSA_PRIVATEKEY	Private key material in ASN.1 coded form (BER coding). The key material is provided in binary form, not, e.g. as a BASE64 string.
CRYPTO_KE_FORMAT_BIN_RSA_PUBLICKEY	Public key material in ASN.1 coded form (BER coding). The key material is provided in binary form, not, e.g. as a BASE64 string.

A binary Octet is the integer representation in base 256. A large value can be splitted into his factors:

$$X = X_{xLen-1} * 256^{xLen-1} + X_{xLen-2} * 256^{xLen-2} + \dots + X_1 * 256 + X_0. \text{ where } 0 \leq X_i < 256.$$

Let the Octet Xi have the integer value x_{xLen-i} for $1 \leq i \leq xLen$. The octet is then

$$X = X_1 X_2 \dots X_{xLen}$$

Rationale: An asymmetric key can either be provided with or without identification. The identification is used to uniquely identify the key itself that is provided, so that the key parser can check if the key material is appropriate or not. Without identification, the key material must correspond to the format that is specified for this key. Following IETF standards, the identification of a key is provided as an object identifier (OID) as part of the ASN.1 description.]

(SRS_CryptoStack_00008)

[SWS_Csm_00952] [Vendor specific keyElementIds should start 1000 to avoid interferences with future extended versions of the Crypto Stack.]

]()

Note:

The key elements CRYPTO_KE_[...].ALGORITHM are used to configure the behavior of the key management functions, because they are independent of jobs and therefore can not be configured like a primitive.

[SWS_Csm_01092] [If a cryptographic primitive uses elliptic curve algorithm but the concrete curve parameter cannot sufficiently specified by its algorithm families and its algorithm mode, an additional key element of type CRYPTO_KE_xxxxx_CURVETYPE shall be used to provide the required information. This information is set at runtime through the key element interface. The data of the key element shall be set with its object identifier follows the format defined in [19] and [20].

] (SRS_CryptoStack_00008)

Example: Definition for an ECC Brainpool 160 P1 key used for signature generation.

```
P2CONST(uint8, AUTOMATIC, MSN_CONST) EccKey =
{ 0x12, 0x23, 0x34, ... }
; // The required key value.

// According to RFC5639:
// {iso(1) identified-organization(3) teletrust(36)
algorithm(3) signatureAlgorithm(3) ecSign(2)
ecStdCurvesAndGeneration(8) ellipticCurve(1) }

brainpoolP160r1(1)
P2CONST(uint8, AUTOMATIC, MSN_CONST) EccType =
{ 1, 3, 36, 3, 3, 2, 8, 1, 1 }
; //OID definition of ECC Brainpool 160 P1

Csm_KeyElementSet(MyEccKeyId, CRYPTO_KE_SIGNATURE_KEY, EccKey,
sizeof(EccKey) );
Csm_KeyElementSet(MyEccKeyId, CRYPTO_KE_SIGNATURE_CURVETYPE,
EccType, sizeof(EccType) );
Csm_KeySetValid(MyEccKeyId);
```

7.2.2.4 Redirection of Input and/or Output of Crypto Jobs

[SWS_Csm_91013] [The input and/or output data of a job can be re-directed to a key element. Which input and output value to which key and its key element is re-directed shall be statically configured at compile time and shall not be changed at runtime.

]()

[SWS_Csm_91014] If an input or output value of a job is re-directed to a key element (CsmInOutRedirectionRef ECUC_Csm_00262 is existing) and the corresponding input or output length value is not set to 0, the job shall not be processed and E_NOT_OK shall be returned.

]()

[SWS_Csm_91015] If input or output redirection is not used for a job element (no CsmInOutRedirectionRef ECUC_Csm_00262 is existing), jobRedirectionInfoRef shall be set to NULL_PTR. If redirection is used element (CsmInOutRedirectionRef ECUC_Csm_00262 is existing) the jobRedirectionInfoRef shall point to a structure of Crypto_JobRedirectionInfoType.

]()

[SWS_Csm_91016] The structure Crypto_JobRedirectionInfoType contains information which key elements shall be used for redirection. A bit field called redirectionConfig is provided that indicates which input and/or output value is redirected.

The value of redirectionConfig is a bit coded value that is used to indicate, which of the input and output buffers are redirected. If the least significant bit (Bit #0 or 0x01) of redirectionConfig is set the primary input key and its element is redirected and the value of inputKeyId and inputKeyElementId must indicate the element that is used for input buffer instead of the inputPtr and its length. If Bit #1 is set, the secondaryInputBuffer is redirected to the secondary input key is set and the key and key elements must be set, and Bit #2 is used for the tertiary input key. Bit #3 is reserved for future use.

If Bit #4 is set the outputPtr is redirected to the output key element of the output key. Bit #5 indicates the redirection of the secondary output buffer to the secondary key and its key element. If a bit is set to 0 the input or output shall not be redirected to the associated Key Element.

Example: A value of redirectionConfig of "00110001" indicates that the input should be gathered from the inputKeyElement of inputKeyId and that the output buffer and secondary output buffer shall be redirected to the outputKeyElement of outputKeyId and secondaryOutputKeyElement of secondaryOutputKeyId.

]()

7.2.2.5 Job context interface

The job context interface allows to save or restore the context data of the workspace for a specific crypto service from the crypto driver. This allows to store all dynamically created data within a crypto driver so that it can later be restored to continue this operation at the exact point where the context snapshot was taken.

Key element data are not affected. This means, that key elements are not part of the context data and must be set or read by the key element interface separately if necessary.

[SWS_Csm_91069] [In addition to the standard error detection described in chapter 7.4, on a call to `Csm_SaveContextJob()` or `Csm_RestoreContextJob()` the CSM shall check if the related job is currently active. If so, the operation shall continue as specified. Otherwise (the job is in IDLE state), the function shall immediately return with `E_NOT_OK`.]()

[SWS_Csm_91070] [On a call to `Csm_SaveContextJob()` or `Csm_RestoreContextJob()` the CSM shall check if the related job is currently actively processing data, means the CSM has scheduled an operation related to this job to the driver and is waiting for a response. In this case, the function shall immediately return with `E_NOT_OK`.]()

[SWS_Csm_91071] [On a call to `Csm_RestoreContextJob()` or `Csm_SaveContextJob()` the CSM shall check if the job references to either of the `CsmPrimitive` `CsmHash`, `CsmEncrypt`, `CsmEncryptAEAD`, `CsmDecryptAEAD`, `CsmDecrypt`, `CsmMacGenerate`, `CsmMacVerify`, `CsmSignatureGenerate` or `CsmSignatureVerify`. If so, the operation shall continue as specified. Otherwise, the operation shall not be performed and `CSM_E_SERVICE_TYPE` shall be reported to the DET when `CsmDevErrorDetect` is true.]()

7.3 Error Classification

Section 7.2 "Error Handling" of the document "General Specification of Basic Software Modules" describes the error handling of the Basic Software in detail. Above all, it constitutes a classification scheme consisting of five error types which may occur in BSW modules.

Based on this foundation, the following section specifies particular errors arranged in the respective subsections below.

7.3.1 Development Errors

[SWS_Csm_91004] [

Type of error	Related error code	Error value
API request called with invalid parameter (Nullpointer)	<code>CSM_E_PARAM_POINTER</code>	0x01
Csm Configuration ID out of range	<code>CSM_E_PARAM_HANDLE</code>	0x04
API request called before initialization of CSM module	<code>CSM_E_UNINIT</code>	0x05
Initialization of CSM module failed	<code>CSM_E_INIT_FAILED</code>	0x07

API request called with invalid processing mode	CSM_E_PROCESSING_MODE	0x08
Mismatch between the called API request and the service type of the job	CSM_E_SERVICE_TYPE	0x09

] (SRS_CryptoStack_00086)

7.3.2 Runtime Errors

[SWS_Csm_01089] [

Type of error	Related error code	Error value
Queue overrun	CSM_E_QUEUE_FULL	0x01

] (SRS_CryptoStack_00086)

7.3.3 Transient Faults

There are no transient faults.

7.3.4 Production Errors

There are no production errors.

7.3.5 Extended Production Errors

There are no extended production errors.

7.4 Error Detection

[SWS_Csm_91008] [While the CSM is not initialized and any function of the CSM API is called, except of `CSM_Init()` and `Csm_GetVersionInfo()`, the operation shall not be performed and `CSM_E_UNINIT` shall be reported to the DET when `CsmDevErrorDetect` is true.
] ()

[SWS_Csm_91009] [If a pointer to null is passed to an API function and the corresponding input or output data are not re-directed to a key element, the operation shall not be performed and `CSM_E_PARAM_POINTER` shall be reported to the DET when `CsmDevErrorDetect` is true.
] ()

[SWS_Csm_91011] [If a CSM API with a ID handle in its interface is called and the ID handle is out of range, the operation shall not be performed and

CSM_E_PARAM_HANDLE shall be reported to the DET when CsmDevErrorDetect is true.

]()

[SWS_Csm_01091] [If a CSM API with a job handle (called jobId) in its interface is called and the Crypto_ServiceInfoType of the job does not match the requested service, the operation shall not be performed and CSM_E_SERVICE_TYPE shall be reported to the DET when CsmDevErrorDetect is true.

] (SRS_CryptoStack_00087)

[SWS_Csm_01088] [If a CSM job needs to be queued and the queue is full, the runtime error CSM_E_QUEUE_FULL shall be reported to the DET.

] (SRS_CryptoStack_00087)

Note: The indication of a queue overrun is logged as runtime error.

7.5 Multicore

In case the Crypto-Stack is distributed across several partitions, Csm shall allow calls of its <sevice> APIs in different partitions.

[SWS_Csm_91065] [CsmQueues shall be handled within the MainFunction, which is referenced via CsmJobMainFunctionRef.

]()

Note:

In case the a CsmJob is not processed inside MainFunction context at all (Synchronous interfacing), the MainFunction assignment (via the respective CsmQueue) defines the partition, where the CsmJob is assigned to.

[SWS_Csm_91066] [The Csm module shall apply appropriate mechanisms to allow calls of Csm_<Service>() API from partitions its CsmJobs are assigned to.

]()

8 API Specification

8.1 Imported types

[SWS_Csm_00068] [Only the standard AUTOSAR types provided by Std_Types.h shall be imported.
]()

8.2 Type Definitions

8.2.1 Extension to Std_ReturnType

[SWS_Csm_91043][

Range	CRYPTO_E_BUSY	0x02	The service request failed because the service is still busy
	CRYPTO_E_ENTROPY_EXHAUSTED	0x04	The service request failed because the entropy of the random number generator is exhausted
	CRYPTO_E_KEY_READ_FAIL	0x06	The service request failed because read access was denied
	CRYPTO_E_KEY_WRITE_FAIL	0x07	The service request failed because the writing access failed
	CRYPTO_E_KEY_NOT_AVAILABLE	0x08	The service request failed because at least one required key element is not available.
	CRYPTO_E_KEY_NOT_VALID	0x09	The service request failed because the key is invalid.
	CRYPTO_E_KEY_SIZE_MISMATCH	0x0A	The service request failed because the key size does not match.
	CRYPTO_E_JOB_CANCELED	0x0C	The service request failed because the Job has been canceled.
	CRYPTO_E_KEY_EMPTY	0x0D	The service request failed because of uninitialized source key element.
Description	--		
Available via	Crypto_GeneralTypes.h		

] (SRS_CryptoStack_00095)

8.2.2 Csm_ConfigType

[SWS_Csm_01085][

Name	Csm_ConfigType
-------------	----------------

Kind	Structure				
Elements	implementation specific				
	Type	--			
	Comment	The content of the configuration data structure is implementation specific.			
Description	Configuration data structure of Csm module				
Available via	Csm.h				

] (SWS_BSW_00216)

8.2.3 Crypto_AlgorithmFamilyType

[SWS_Csm_01047][

Name	Crypto_AlgorithmFamilyType		
Kind	Enumeration		
Range	CRYPTO_ALGOFAM_NOT_SET	0x00	Algorithm family is not set
	CRYPTO_ALGOFAM_SHA1	0x01	SHA1 hash

]()

8.2.6 Crypto_JobType

[SWS_Csm_01013]

Name	Crypto_JobType		
Kind	Structure		
Elements	jobId		
	Type	uint32	
	Comment	Identifier for the job structure.	
	jobState		
	Type	Crypto_JobStateType	
	Comment	Determines the current job state.	
	jobPrimitiveInputOutput		
	Type	Crypto_JobPrimitiveInputOutputType	
	Comment	Structure containing input and output information depending on the job and the crypto primitive.	
	jobPrimitiveInfo		

	Comment	Identifier of the Crypto Driver key. The identifier shall be written by the Crypto Interface.
jobRedirectionInfoRef		
	Type	Crypto_JobRedirectionInfoType*
	Comment	Pointer to a structure containing further information on the usage of keys as input and output for jobs.
targetCryptoKeyId		
	Type	uint32
	Comment	Target identifier of the Crypto Driver key. The identifier shall be written by the Crypto Interface.
jobPriority		
	Type	const uint32
	Comment	Specifies the importance of the job (the higher, the more important).
Description	Structure which contains further information, which depends on the job and the crypto primitive.	
Available via	Crypto_GeneralTypes.h

8.2.7 Crypto_JobStateType

[SWS_Csm_01028][

Name	Crypto_JobStateType		
Kind	Enumeration		
Range	CRYPTO_JOBSTATE_IDLE	0x00	Job is in the state "idle". This state is reached after Csm_Init() or when the "Finish" state is finished.
	CRYPTO_JOBSTATE_ACTIVE	0x01	Job is in the state "active". There was already some input or there are intermediate results. This state is reached, when the "update" or "start" operation finishes.
Description	Enumeration of the current job state.		
Available via	Crypto_GeneralTypes.h		

]()

8.2.8 Crypto_JobPrimitiveInputOutputType

[SWS_Csm_01009][

Name	Crypto_JobPrimitiveInputOutputType	
Kind	Structure	
		inputPtr
Type	const uint8*	
Comment	Pointer to the input data.	
		inputLength
Type	uint32	
Comment	Contains the input length in bytes.	
		secondaryInputPtr
Type	const uint8*	
Comment	Pointer to the secondary input data (for MacVerify, SignatureVerify).	
		secondaryInputLength
Type	uint32	
Comment	Contains the secondary input length in bits or bytes, depending on the requested service.	
		tertiaryInputPtr
Type	const uint8*	
Comment	Pointer to the tertiary input data (for MacVerify, SignatureVerify).	
		tertiaryInputLength
Type	uint32	
Comment	Contains the tertiary input length in bytes.	
		outputPtr
Type	uint8*	
Comment	Pointer to the output data.	
		outputLengthPtr
Type	uint32*	
Comment	Holds a pointer to a memory location containing the output length in bytes.	
		secondaryOutputPtr
Type	uint8*	
Comment	Pointer to the secondary output data.	
		secondaryOutputLengthPtr

	Type	uint32*
	Comment	Holds a pointer to a memory location containing the secondary output length in bytes.
verifyPtr		
	Type	Crypto_VerifyResultType*
	Comment	Output pointer to a memory location holding a Crypto_VerifyResultType
mode		
	Type	Crypto_OperationModeType
	Comment	Indicator of the mode(s)/operation(s) to be performed
cryIfKeyId		
	Type	uint32
	Comment	Holds the CryIf key id for key operation services.
targetCryIfKeyId		
	Type	uint32
	Comment	Holds the target CryIf key id for key operation services.
Description	Structure which contains input and output information depending on the job and the crypto primitive.

]()

8.2.11 Crypto_JobRedirectionInfoType

[SWS_Csm_91026]

Name	Crypto_JobRedirectionInfoType	
Kind	Structure	
Elements	redirectionConfig	
	Type	uint8
	Comment	Bit structure which indicates which buffer shall be redirected to a key element. Values from Crypto_InputOutputRedirectionConfigType can be used and combined with unary OR operation.
	inputKeyId	
	Type	uint32
	Comment	Identifier of the key which shall be used as input
	inputKeyElementId	
	Type	uint32
	Comment	Identifier of the key element which shall be used as input
	secondaryInputKeyId	
	Type	uint32
	Comment	Identifier of the key which shall be used as secondary input
	secondaryInputKeyElementId	
	Type	uint32
	Comment	Identifier of the key element which shall be used as secondary input
	tertiaryInputKeyId	
	Type	uint32
	Comment	Identifier of the key which shall be used as tertiary input
	tertiaryInputKeyElementId	

	Type	uint32
	Comment	Identifier of the key element which shall be used as tertiary input
outputKeyId		
	Type	uint32
	Comment	Identifier of the key which shall be used as output
outputKeyElementId		
	Type	uint32
	Comment	Identifier of the key element which shall be used as output
secondaryOutputKeyId		
	Type	uint32
	Comment	Identifier of the key which shall be used as secondary output
secondaryOutputKeyElementId		
	Type	uint32
	Comment	Identifier of the key element which shall be used as secondary output
Description	Structure which holds the identifiers of the keys and key elements which shall be used as input and output for a job and a bit structure which indicates which buffers shall be redirected to those key elements.	
Available via	Crypto_GeneralTypes.h	

]()

8.2.12 Crypto_AlgorithmInfoType

[SWS_Csm_01008][

Name	Crypto_AlgorithmInfoType	
Kind	Structure	
Elements	family	
	Type	Crypto_AlgorithmFamilyType
	Comment	The family of the algorithm
	secondaryFamily	
	Type	Crypto_AlgorithmFamilyType
	Comment	The secondary family of the algorithm
keyLength		

	Type	uint32
	Comment	The key length in bits to be used with that algorithm
mode		
	Type	Crypto_AlgorithmModeType
	Comment	The operation mode to be used with that algorithm
Description	Structure which determines the exact algorithm. Note, not every algorithm needs to specify all fields. AUTOSAR shall only allow valid combinations.	
Available via	Crypto_GeneralTypes.h	

]()

8.2.13 Crypto_ProcessingType

[SWS_Csm_01049][

Name	Crypto_ProcessingType		
Kind	Enumeration		
Range	CRYPTO_PROCESSING_ASYNC	0x00	Asynchronous job processing
	CRYPTO_PROCESSING_SYNC	0x01	Synchronous job processing
Description	Enumeration of the processing type.		
Available via	Crypto_GeneralTypes.h		

] (SRS_CryptoStack_00100, SRS_CryptoStack_00101)

8.2.15 Csm_ConfigIdType

[SWS_Csm_00691][

Name	Csm_ConfigIdType		
Kind	Type		
Derived from	uint16		
Range	0..65535	--	--
Description	Identification of a CSM service configuration via a numeric identifier, that is unique within a service. The name of a CSM service configuration, i.e. the name of the container Csm_<Service>Config, shall serve as a symbolic name for this parameter		
Available via	Csm.h		

] (SRS_Csm_00066)

8.3 Function Definitions

[SWS_Csm_00478] [All functions need not to be reentrant. For behavior in case of a reentrant call see SWS_Csm_00017.]()

8.3.1 General Interface

8.3.1.1 Csm_Init

[SWS_Csm_00646][

Service Name	Csm_Init		
Syntax	<pre>void Csm_Init (const Csm_ConfigType* configPtr)</pre>		
Service ID [hex]	0x00		
Sync/Async	Synchronous		
Reentrancy	Non Reentrant		
Parameters (in)	configPtr	Pointer to a selected configuration structure	

Parameters (inout)	None
Parameters (out)	None
Return value	None
Description	Initializes the CSM module. In configurations, in which Csm is assigned to more than one partition (i.e. Csm_MainFunctions are mapped to partitions), Csm may provide one init function per partition.
Available via	Csm.h

] (SRS_BSW_00101, SRS_BSW_00358, SRS_BSW_00414)

[SWS_Csm_00186] [The Configuration pointer configPtr shall always have a null pointer value.

] (SWS_BSW_00050)

The Configuration pointer configPtr is currently not used and shall therefore be set null pointer value.

[SWS_Csm_00659] [If the initialization of the CSM module fails, the CSM shall report CSM_E_INIT_FAILED to the DET when CsmDevErrorDetect is true.

] ()

8.3.1.2 Csm_GetVersionInfo

[SWS_Csm_00705] [

Service Name	Csm_GetVersionInfo	
Syntax	<pre>void Csm_GetVersionInfo (Std_VersionInfoType* versioninfo)</pre>	
Service ID [hex]	0x3b	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	None	
Parameters (inout)	None	
Parameters (out)	versioninfo	Pointer to where to store the version information of this module.
Return value	None	
Description	Returns the version information of this module.	
Available via	Csm.h	

] (SRS_BSW_00407)

8.3.2 Hash Interface

A cryptographic hash function is a deterministic procedure that takes an arbitrary block of data and returns a fixed-size bit string, the hash value, such that an accidental or intentional change to the data will change the hash value. Main properties of hash functions are that it is infeasible to find a message that has a given hash or to find two different messages with the same hash.

8.3.2.1 Csm_Hash

[SWS_Csm_00980]

Service Name	Csm_Hash	
Syntax	<pre>Std_ReturnType Csm_Hash (uint32 jobId, Crypto_OperationModeType mode, const uint8* dataPtr, uint32 dataLength, uint8* resultPtr, uint32* resultLengthPtr)</pre>	
Service ID [hex]	0x5d	
Sync/Async	Synchronous or Async, depending on the job configuration	
Reentrancy	Reentrant	
Parameters (in)	jobId	Holds the identifier of the job using the CSM service.
	mode	Indicates which operation mode(s) to perform.
	dataPtr	Contains the pointer to the data for which the hash shall be computed.
	dataLength	Contains the number of bytes to be hashed.
Parameters (inout)	resultLengthPtr	Holds a pointer to the memory location in which the output length in bytes is stored. On calling this function, this parameter shall contain the size of the buffer provided by resultPtr. When the request has finished, the actual length of the returned value shall be stored. If the provided length information is smaller than the total length of the hash result, the resultPtr will contain the truncated hash result.
Parameters (out)	resultPtr	Contains the pointer to the data where the hash value shall be stored.
Return value	Std_-Return-Type	E_OK: Request successful E_NOT_OK: Request failed
Description	Uses the given data to perform the hash calculation and stores the hash.	
Available via	Csm.h	

J(SRS_CryptoStack_00024)

8.3.3 MAC interface

A message authentication code (MAC) is a short piece of information used to authenticate a message. A MAC algorithm accepts as input a secret key and an arbitrary-length message to be authenticated, and outputs a MAC. The MAC value protects both a message's data integrity as well as its authenticity, by allowing verifiers (who also possess the secret key) to detect any changes to the message content.

8.3.3.1 Csm_MacGenerate

[SWS_Csm_00982][

Service Name	Csm_MacGenerate	
Syntax	<pre>Std_ReturnType Csm_MacGenerate (uint32 jobId, Crypto_OperationModeType mode, const uint8* dataPtr, uint32 dataLength, uint8* macPtr, uint32* macLengthPtr)</pre>	
Service ID [hex]	0x60	
Sync/Async	Synchronous or Async, depending on the job configuration	
Reentrancy	Reentrant	
Parameters (in)	jobId	Holds the identifier of the job using the CSM service.
	mode	Indicates which operation mode(s) to perform.
	dataPtr	Contains the pointer to the data for which the MAC shall be computed.
	dataLength	Contains the number of bytes to be hashed.
Parameters (inout)	macLengthPtr	Holds a pointer to the memory location in which the output length in bytes is stored. On calling this function, this parameter shall contain the size of the buffer provided by macPtr. When the request has finished, the actual length of the returned MAC shall be stored. If the provided length information is smaller than the total length of the MAC result, the macPtr will contain the truncated MAC result.
Parameters (out)	macPtr	Contains the pointer to the data where the MAC shall be stored.
Return value	Std_ReturnType	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, service is still busy

		CRYPTO_E_KEY_NOT_VALID: Request failed, the key's state is "invalid" CRYPTO_E_KEY_SIZE_MISMATCH: Request failed, a key element has the wrong size CRYPTO_E_KEY_EMPTY: Request failed because of uninitialized source key element
Description	Uses the given data to perform a MAC generation and stores the MAC in the memory location pointed to by the MAC pointer.	
Available via	Csm.h	

](SRS_CryptoStack_00022)

8.3.3.2 Csm_MacVerify

[SWS_Csm_01050]

Service Name	Csm_MacVerify	
Syntax	<pre>Std_ReturnType Csm_MacVerify (uint32 jobId, Crypto_OperationModeType mode, const uint8* dataPtr, uint32 dataLength, const uint8* macPtr, const uint32 macLength, Crypto_VerifyResultType* verifyPtr)</pre>	
Service ID [hex]	0x61	
Sync/Async	Synchronous or Async, depending on the job configuration	
Reentrancy	Reentrant	
Parameters (in)	jobId	Holds the identifier of the job using the CSM service.
	mode	Indicates which operation mode(s) to perform.
	dataPtr	Holds a pointer to the data for which the MAC shall be verified.
	dataLength	Contains the number of data bytes for which the MAC shall be verified.
	macPtr	Holds a pointer to the MAC to be verified.
	macLength	Contains the MAC length in BITS to be verified.
Parameters (inout)	None	
Parameters (out)	verifyPtr	Holds a pointer to the memory location, which will hold the result of the MAC verification.
Return value	Std_Return-Type	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, service is still busy CRYPTO_E_KEY_NOT_VALID: Request failed, the key's state

		is "invalid" CRYPTO_E_KEY_SIZE_MISMATCH: Request failed, a key element has the wrong size CRYPTO_E_KEY_EMPTY: Request failed because of uninitialized source key element
Description	Verifies the given MAC by comparing if the MAC is generated with the given data.	
Available via	Csm.h	

]()

8.3.4 Cipher Interface

The cipher interfaces can be used for symmetrical and asymmetrical encryption or decryption. Furthermore, it is also possible to use these interfaces for compression and decompression, respectively.

8.3.4.1 Csm_Encrypt

[SWS_Csm_00984]

Service Name	Csm_Encrypt	
Syntax	<pre>Std_ReturnType Csm_Encrypt (uint32 jobId, Crypto_OperationModeType mode, const uint8* dataPtr, uint32 dataLength, uint8* resultPtr, uint32* resultLengthPtr)</pre>	
Service ID [hex]	0x5e	
Sync/Async	Synchronous or Async, depending on the job configuration	
Reentrancy	Reentrant	
Parameters (in)	jobId	Holds the identifier of the job using the CSM service.
	mode	Indicates which operation mode(s) to perform.
	dataPtr	Contains the pointer to the data to be encrypted.
	dataLength	Contains the number of bytes to encrypt.
Parameters (inout)	resultLengthPtr	Holds a pointer to the memory location in which the output length information is stored in bytes. On calling this function, this parameter shall contain the size of the buffer provided by resultPtr. When the request has finished, the actual length of the returned value shall be stored.

Parameters (out)	resultPtr	Contains the pointer to the data where the encrypted data shall be stored.
Return value	Std - Return-Type	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, service is still busy CRYPTO_E_KEY_NOT_VALID: Request failed, the key's state is "invalid" CRYPTO_E_KEY_SIZE_MISMATCH: Request failed, a key element has the wrong size CRYPTO_E_KEY_EMPTY: Request failed because of uninitialized source key element
Description	Encrypts the given data and store the ciphertext in the memory location pointed by the result pointer.	
Available via	Csm.h	

](SRS_CryptoStack_00020, SRS_CryptoStack_00021)

In the case of block ciphers, it shall be possible to pass a dataLength which is not a multiple of the corresponding block size. The underlying Crypto Driver is responsible for handling these input data.

8.3.4.2 Csm_Decrypt

[SWS_Csm_00989]

Service Name	Csm_Decrypt	
Syntax	<pre>Std_ReturnType Csm_Decrypt (uint32 jobId, Crypto_OperationModeType mode, const uint8* dataPtr, uint32 dataLength, uint8* resultPtr, uint32* resultLengthPtr)</pre>	
Service ID [hex]	0x5f	
Sync/Async	Synchronous or Async, depending on the job configuration	
Reentrancy	Reentrant	
Parameters (in)	jobId	Holds the identifier of the job using the CSM service.
	mode	Indicates which operation mode(s) to perform.
	dataPtr	Contains the pointer to the data to be decrypted.
	dataLength	Contains the number of bytes to decrypt.

Parameters (inout)	resultLengthPtr	Holds a pointer to the memory location in which the output length information is stored in bytes. On calling this function, this parameter shall contain the size of the buffer provided by resultPtr. When the request has finished, the actual length of the returned value shall be stored.
Parameters (out)	resultPtr	Contains the pointer to the memory location where the decrypted data shall be stored.
Return value	Std_ReturnType	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, service is still busy CRYPTO_E_KEY_NOT_VALID: Request failed, the key's state is "invalid" CRYPTO_E_KEY_SIZE_MISMATCH: Request failed, a key element has the wrong size CRYPTO_E_KEY_EMPTY: Request failed because of uninitialized source key element
Description	Decrypts the given encrypted data and store the decrypted plaintext in the memory location pointed by the result pointer.	
Available via	Csm.h	

] (SRS_CryptoStack_00020, SRS_CryptoStack_00021)

8.3.5 Authenticated Encryption with Associated Data (AEAD) Interface

AEAD (also known as Authenticated Encryption) is a block cipher mode of operation which also allows integrity checks (e.g. AES-GCM).

8.3.5.1 Csm_AEADEncrypt

[SWS_Csm_01023] [

Service Name	Csm_AEADEncrypt
Syntax	<pre>Std_ReturnType Csm_AEADEncrypt (uint32 jobId, Crypto_OperationModeType mode, const uint8* plaintextPtr, uint32 plaintextLength, const uint8* associatedDataPtr, uint32 associatedDataLength, uint8* ciphertextPtr, uint32* ciphertextLengthPtr, uint8* tagPtr, uint32* tagLengthPtr)</pre>
Service ID [hex]	0x62
Sync/Async	Synchronous or Async, depending on the job configuration

Reentrancy	Reentrant	
Parameters (in)	jobId	Holds the identifier of the job using the CSM service.
	mode	Indicates which operation mode(s) to perform.
	plaintextPtr	Contains the pointer to the data to be encrypted.
	plaintextLength	Contains the number of bytes to encrypt.
	associatedDataPtr	Contains the pointer to the associated data.
	associatedDataLength	Contains the number of bytes of the associated data.
Parameters (inout)	ciphertextLengthPtr	Holds a pointer to the memory location in which the output length in bytes of the ciphertext is stored. On calling this function, this parameter shall contain the size of the buffer in bytes provided by resultPtr. When the request has finished, the actual length of the returned value shall be stored.
	tagLengthPtr	Holds a pointer to the memory location in which the output length in bytes of the Tag is stored. On calling this function, this parameter shall contain the size of the buffer in bytes provided by resultPtr. When the request has finished, the actual length of the returned value shall be stored.
Parameters (out)	ciphertextPtr	Contains the pointer to the data where the encrypted data shall be stored.
	tagPtr	Contains the pointer to the data where the Tag shall be stored.
Return value	Std_Return-Type	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, service is still busy CRYPTO_E_KEY_NOT_VALID: Request failed, the key's state is "invalid" CRYPTO_E_KEY_SIZE_MISMATCH: Request failed, a key element has the wrong size CRYPTO_E_KEY_EMPTY: Request failed because of uninitialized source key element
Description	Uses the given input data to perform a AEAD encryption and stores the ciphertext and the MAC in the memory locations pointed by the ciphertext pointer and Tag pointer.	
Available via	Csm.h	

]()

8.3.5.2 Csm_AEADDecrypt

[SWS_Csm_01026]

Service Name	Csm_AEADDecrypt
---------------------	-----------------

Syntax	<pre>Std_ReturnType Csm_AEADDecrypt (uint32 jobId, Crypto_OperationModeType mode, const uint8* ciphertextPtr, uint32 ciphertextLength, const uint8* associatedDataPtr, uint32 associatedDataLength, const uint8* tagPtr, uint32 tagLength, uint8* plaintextPtr, uint32* plaintextLengthPtr, Crypto_VerifyResultType* verifyPtr)</pre>	
Service ID [hex]	0x63	
Sync/Async	Synchronous or Async, depending on the job configuration	
Reentrancy	Reentrant	
Parameters (in)	jobId	Holds the identifier of the job using the CSM service.
	mode	Indicates which operation mode(s) to perform.
	ciphertextPtr	Contains the pointer to the data to be decrypted.
	ciphertextLength	Contains the number of bytes to decrypt.
	associatedDataPtr	Contains the pointer to the associated data.
	associatedDataLength	Contains the length in bytes of the associated data.
	tagPtr	Contains the pointer to the Tag to be verified.
	tagLength	Contains the length in bytes of the Tag to be verified.
Parameters (inout)	plaintextLengthPtr	Holds a pointer to the memory location in which the output length in bytes of the plaintext is stored. On calling this function, this parameter shall contain the size of the buffer provided by plaintextPtr. When the request has finished, the actual length of the returned value shall be stored.
Parameters (out)	plaintextPtr	Contains the pointer to the data where the decrypted data shall be stored.
	verifyPtr	Contains the pointer to the result of the verification.
Return value	Std_ReturnType	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, service is still busy CRYPTO_E_KEY_NOT_VALID: Request failed, the key's state is "invalid" CRYPTO_E_KEY_SIZE_MISMATCH: Request failed, a key element has the wrong size CRYPTO_E_KEY_EMPTY: Request failed because of uninitialized source key element

Description	Uses the given data to perform an AEAD encryption and stores the ciphertext and the MAC in the memory locations pointed by the ciphertext pointer and Tag pointer.
Available via	Csm.h

]()

8.3.6 Signature Interface

A digital signature is a type of asymmetric cryptography. Digital signatures are equivalent to traditional handwritten signatures in many respects. Digital signatures can be used to authenticate the source of messages as well as to prove integrity of signed messages. If a message is digitally signed, any change in the message after signature will invalidate the signature. Furthermore, there is no efficient way to modify a message and its signature to produce a new message with a valid signature.

8.3.6.1 Csm_SignatureGenerate

[SWS_Csm_00992]

Service Name	Csm_SignatureGenerate	
Syntax	<pre>Std_ReturnType Csm_SignatureGenerate (uint32 jobId, Crypto_OperationModeType mode, const uint8* dataPtr, uint32 dataLength, uint8* signaturePtr, uint32* signatureLengthPtr)</pre>	
Service ID [hex]	0x76	
Sync/Async	Synchronous or Async, depending on the job configuration	
Reentrancy	Reentrant	
Parameters (in)	jobId	Holds the identifier of the job using the CSM service.
	mode	Indicates which operation mode(s) to perform.
	dataPtr	Contains the pointer to the data to be signed.
	dataLength	Contains the number of bytes to sign.
Parameters (inout)	signatureLengthPtr	Holds a pointer to the memory location in which the output length in bytes of the signature is stored. On calling this function, this parameter shall contain the size of the buffer provided by resultPtr. When the request has finished, the actual length of the returned value shall be stored.
Parameters (out)	signaturePtr	Contains the pointer to the data where the signature shall be stored.

Return value	Std_ReturnType	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, service is still busy CRYPTO_E_KEY_NOT_VALID: Request failed, the key's state is "invalid" CRYPTO_E_KEY_SIZE_MISMATCH: Request failed, a key element has the wrong size CRYPTO_E_KEY_EMPTY: Request failed because of uninitialized source key element
Description	Uses the given data to perform the signature calculation and stores the signature in the memory location pointed by the result pointer.	
Available via	Csm.h	

] (SRS_CryptoStack_00023)

8.3.6.2 Csm_SignatureVerify

[SWS_Csm_00996]

Service Name	Csm_SignatureVerify	
Syntax	<pre>Std_ReturnType Csm_SignatureVerify (uint32 jobId, Crypto_OperationModeType mode, const uint8* dataPtr, uint32 dataLength, const uint8* signaturePtr, uint32 signatureLength, Crypto_VerifyResultType* verifyPtr)</pre>	
Service ID [hex]	0x64	
Sync/Async	Synchronous or Async, depending on the job configuration	
Reentrancy	Reentrant	
Parameters (in)	jobId	Holds the identifier of the job using the CSM service.
	mode	Indicates which operation mode(s) to perform.
	dataPtr	Contains the pointer to the data to be verified.
	dataLength	Contains the number of data bytes.
	signaturePtr	Holds a pointer to the signature to be verified.
	signatureLength	Contains the signature length in bytes.
Parameters (inout)	None	
Parameters (out)	verifyPtr	Holds a pointer to the memory location, which will hold the result of the signature verification.

Return value	Std_ReturnType	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, service is still busy CRYPTO_E_KEY_NOT_VALID: Request failed, the key's state is "invalid" CRYPTO_E_KEY_SIZE_MISMATCH: Request failed, a key element has the wrong size CRYPTO_E_KEY_EMPTY: Request failed because of uninitialized source key element
Description	Verifies the given MAC by comparing if the signature is generated with the given data.	
Available via	Csm.h	

] (SRS_CryptoStack_00023)

8.3.7 Random Interface

The random interface provides generation of random numbers. A random number can be generated either by a physical device (true random number generator), or by computational algorithms (pseudo random number generator). The randomness of pseudo random number generators can be increased by an appropriate selection of the seed.

8.3.7.1 Csm_RandomGenerate

[SWS_Csm_01543] [

Service Name	Csm_RandomGenerate	
Syntax	<pre>Std_ReturnType Csm_RandomGenerate (uint32 jobId, uint8* resultPtr, uint32* resultLengthPtr)</pre>	
Service ID [hex]	0x72	
Sync/Async	Synchronous or Async, depending on the job configuration	
Reentrancy	Reentrant	
Parameters (in)	jobId	Holds the identifier of the job using the CSM service.
Parameters (inout)	result Length Ptr	Holds a pointer to the memory location in which the result length in bytes is stored. On calling this function, this parameter shall contain the number of random bytes, which shall be stored to the buffer provided by resultPtr. When the request has finished, the actual length of the returned value shall be stored.
Parameters (out)	resultPtr	Holds a pointer to the memory location which will hold the result of the random number generation.

Return value	Std_- Return- Type	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, service is still busy CRYPTO_E_ENTROPY_EXHAUSTED: Request failed, entropy of random number generator is exhausted
Description	Generate a random number and stores it in the memory location pointed by the result pointer.	
Available via	Csm.h	

] (SRS_CryptoStack_00019)

To generate a random number, no streaming approach is necessary. The interface `Csm_RandomGenerate` can be called arbitrarily often to generate multiple random numbers.

[SWS_Csm_01054] [The operation mode of the `Csm_RandomGenerate()` function call shall be set to "CRYPTO_OPERATIONMODE_SINGLECALL".
]()

8.3.8 Key Management Interface

The following interfaces are used for key management. Basically, a key contains of one ore more key elements. A key element can be part of multiple keys. For example, this allows to derive a key element from a password with one keyId, and to use this derived key element for encryption with another keyId.

Note:

If the actual key element to be modified is directly mapped to flash memory, there could be a bigger delay when calling the key management functions (synchronous operation)

[SWS_Csm_00974] [If a key management function is called, the CSM shall disable processing new jobs from the queue until the next call of the main function.
]()

8.3.8.1 Key Setting Interface

8.3.8.1.1 Csm_KeyElementSet

[SWS_Csm_00957] [

Service Name	Csm_KeyElementSet
Syntax	<pre>Std_ReturnType Csm_KeyElementSet (uint32 keyId, uint32 keyElementId, const uint8* keyElementPtr, uint32 keyElementLength)</pre>

Service ID [hex]	0x78	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	keyId	Holds the identifier of the key for which a new material shall be set.
	keyElementId	Holds the identifier of the key element to be written.
	keyElement Ptr	Holds the pointer to the key element bytes to be processed.
	keyElement Length	Contains the number of key element bytes.
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, Crypto Driver Object is busy CRYPTO_E_KEY_WRITE_FAIL: Request failed because write access was denied CRYPTO_E_KEY_NOT_AVAILABLE: Request failed because the key is not available CRYPTO_E_KEY_SIZE_MISMATCH: Request failed, key element size does not match size of provided data
Description	Sets the given key element bytes to the key identified by keyId.	
Available via	Csm.h	

]()

[SWS_Csm_01002] | If no errors are detected by Csm, the service Csm_KeyElementSet() shall call CryIf_KeyElementSet().
]()

8.3.8.1.2 Csm_KeySetValid

[SWS_Csm_00958] |

Service Name	Csm_KeySetValid
Syntax	Std_ReturnType Csm_KeySetValid (uint32 keyId)
Service ID [hex]	0x67
Sync/Async	Synchronous
Reentrancy	Non Reentrant

Parameters (in)	keyId	Holds the identifier of the key for which a new material shall be validated.
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, Crypro Driver Object is busy
Description	Sets the key state of the key identified by keyId to valid.	
Available via	Csm.h	

]()

[SWS_Csm_01003] If no errors are detected by Csm, the service Csm_KeySetValid() shall call CryIf_KeySetValid().
]()

8.3.8.1.3 Csm_KeySetInvalid

[SWS_Csm_91075]

Service Name	Csm_KeySetInvalid	
Syntax	Std_ReturnType Csm_KeySetInvalid (uint32 keyId)	
Service ID [hex]	0x85	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	keyId	Holds the identifier of the key which shall be invalidated.
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, Crypro Driver Object is busy
Description	Sets the key status to invalid. The key cannot be used any longer for cryptographic operations until it has been set to valid state again.	
Available via	Csm.h	

]()

[SWS_Csm_91050] | If no errors are detected by Csm, the service Csm_KeySetInvalid() shall call CryIf_KeySetInvalid().
]()

8.3.8.2 Key Status Interface

8.3.8.2.1 Csm_KeyGetStatus

[SWS_Csm_91047] |

Service Name	Csm_KeyGetStatus	
Syntax	<pre>Std_ReturnType Csm_KeyGetStatus (uint32 keyId, Crypto_KeyStatusType* keyStatusPtr)</pre>	
Service ID [hex]	0x83	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	keyId	Holds the identifier of the key for which the key state shall be returned.
Parameters (inout)	None	
Parameters (out)	keyStatusPtr	Contains the pointer to the data where the status of the key shall be stored.
Return value	Std_Return-Type	E_OK: Request successful E_NOT_OK: Request failed
Description	Returns the key state of the key identified by keyId.	
Available via	Csm.h	

]()

[SWS_Csm_91048] | If no errors are detected by Csm, the service Csm_KeyGetStatus() shall call CryIf_KeyGetStatus().

]()

8.3.8.3 Key Extraction Interface

8.3.8.3.1 Csm_KeyElementGet

[SWS_Csm_00959] |

Service Name	Csm_KeyElementGet
Syntax	<pre>Std_ReturnType Csm_KeyElementGet (uint32 keyId, uint32 keyElementId, uint8* keyElementPtr,</pre>

	uint32* keyElementLengthPtr)	
Service ID [hex]	0x68	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	keyId	Holds the identifier of the key from which a key element shall be extracted.
	keyElementId	Holds the identifier of the key element to be extracted.
Parameters (inout)	keyElementLengthPtr	Holds a pointer to the memory location in which the output buffer length in bytes is stored. On calling this function, this parameter shall contain the buffer length in bytes of the keyElementPtr. When the request has finished, the actual size of the written input bytes shall be stored.
Parameters (out)	keyElementPtr	Holds the pointer to the memory location where the key element shall be copied to.
Return value	Std_ReturnType	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, Crypto Driver Object is busy CRYPTO_E_KEY_NOT_AVAILABLE: Request failed, the requested key element is not available CRYPTO_E_KEY_READ_FAIL: Request failed because read access was denied CRYPTO_E_KEY_EMPTY: Request failed because of uninitialized source key element
Description	Retrieves the key element bytes from a specific key element of the key identified by the keyId and stores the key element in the memory location pointed by the key pointer.	
Available via	Csm.h	

] (SRS_CryptoStack_00010, SRS_CryptoStack_00011, SRS_CryptoStack_00029)

[SWS_Csm_01004] If no errors are detected by Csm, the service Csm_KeyElementGet () shall call CryIf_KeyElementGet ().
])()

The underlying Crypto Driver has to decide if and how the key element bytes are extracted.

8.3.8.4 Key Copying Interface

8.3.8.4.1 Csm_KeyElementCopy

[SWS_Csm_00969]

Service Name	Csm_KeyElementCopy
---------------------	--------------------

Syntax	<pre>Std_ReturnType Csm_KeyElementCopy (const uint32 keyId, const uint32 keyElementId, const uint32 targetKeyId, const uint32 targetKeyElementId)</pre>				
Service ID [hex]	0x71				
Sync/Async	Synchronous				
Reentrancy	Reentrant, but not for the same keyId				
Parameters (in)	keyId	Holds the identifier of the key whose key element shall be the source element.			
	keyElementId	Holds the identifier of the key element which shall be the source for the copy operation.			
	targetKeyId	Holds the identifier of the key whose key element shall be the destination element.			
	targetKey ElementId	Holds the identifier of the key element which shall be the destination for the copy operation.			
Parameters (inout)	None				
Parameters (out)	None				
Return value	Std_Return-Type	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, Crypto Driver Object is busy CRYPTO_E_KEY_NOT_AVAILABLE: Request failed, the requested key element is not available CRYPTO_E_KEY_READ_FAIL: Request failed, not allowed to extract key element CRYPTO_E_KEY_WRITE_FAIL: Request failed, not allowed to write key element CRYPTO_E_KEY_SIZE_MISMATCH: Request failed, key element sizes are not compatible CRYPTO_E_KEY_EMPTY: Request failed because of uninitialized source key element			
Description	This function shall copy a key elements from one key to a target key.				
Available via	Csm.h				

]()

[SWS_Csm_01032] If no errors are detected by Csm and the `keyId` and `targetKeyId` are located in different Crypto Drivers, the service `Csm_KeyElementCopy()` shall call `CryIf_KeyElementCopy()` and pass on the return value.

]()

8.3.8.4.2 Csm_KeyCopy

[SWS_Csm_01034][

Service Name	Csm_KeyCopy	
Syntax	<pre>Std_ReturnType Csm_KeyCopy (const uint32 keyId, const uint32 targetKeyId)</pre>	
Service ID [hex]	0x73	
Sync/Async	Synchronous	
Reentrancy	Reentrant, but not for same keyId	
Parameters (in)	keyId	Holds the identifier of the key whose key element shall be the source element.
	targetKeyId	Holds the identifier of the key whose key element shall be the destination element.
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, Crypto Driver Object is busy CRYPTO_E_KEY_NOT_AVAILABLE: Request failed, the requested key element is not available CRYPTO_E_KEY_READ_FAIL: Request failed, not allowed to extract key element CRYPTO_E_KEY_WRITE_FAIL: Request failed, not allowed to write key element CRYPTO_E_KEY_SIZE_MISMATCH: Request failed, key element sizes are not compatible CRYPTO_E_KEY_EMPTY: Request failed because of uninitialized source key element
Description	This function shall copy all key elements from the source key to a target key.	
Available via	Csm.h	

]()

[SWS_Csm_01035][If no errors are detected by Csm and the `keyId` and `targetKeyId` are located in the same Crypto Driver, the service `Csm_KeyCopy()` shall call `CryIf_KeyCopy()` and pass on the return value.

]()

8.3.8.4.3 Csm_KeyElementCopyPartial

[SWS_Csm_91025][

Service Name	Csm_KeyElementCopyPartial	
Syntax	<pre>Std_ReturnType Csm_KeyElementCopyPartial (uint32 keyId, uint32 keyElementId, uint32 keyElementSourceOffset, uint32 keyElementTargetOffset, uint32 keyElementCopyLength, uint32 targetKeyId, uint32 targetKeyElementId)</pre>	
Service ID [hex]	0x79	
Sync/Async	Synchronous	
Reentrancy	Reentrant, but not for the same keyId	
Parameters (in)	keyId	Holds the identifier of the key whose key element shall be the source element for copy operation.
	keyElementId	Holds the identifier of the key element which shall be the source for the copy operation.
	keyElementSource Offset	This is the offset of the source key element indicating the start index of the copy operation.
	keyElementTarget Offset	This is the offset of the destination key element indicating the start index of the copy operation.
	keyElementCopy Length	Specifies the number of bytes that shall be copied.
	targetKeyId	Holds the identifier of the key whose key element shall be the destination element.
	targetKeyElementId	Holds the identifier of the key element which shall be the destination for the copy operation.
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, Crypto Driver Object is busy CRYPTO_E_KEY_NOT_AVAILABLE: Request failed, the requested key element is not available CRYPTO_E_KEY_READ_FAIL: Request failed, not allowed to extract key element CRYPTO_E_KEY_WRITE_FAIL: Request failed, not allowed to write key element CRYPTO_E_KEY_SIZE_MISMATCH: Request failed, key element sizes are not compatible

		CRYPTO_E_KEY_EMPTY: Request failed because of uninitialized source key element
Description	Copies a key element to another key element in the same crypto driver. The key ElementSourceOffset and keyElementCopyLength allows to copy just a part of the source key element into the destination. The offset into the target key is also specified with this function.	
Available via	Csm.h	

]()

Note: A Concatenation of partial keys into one key element is possible by calling Csm_KeyElementCopyPartial() multiple times and adjusting keyElementTargetOffset properly.

[SWS_Csm_91019] [If no errors are detected by Csm shall call CryIf_KeyElementCopyPartial() and pass on the return value.
]()

[SWS_Csm_91020] [If the current length of the target key element is greater or equal than (keyElementTargetOffset + keyElementCopyLength), the key element length remains unchanged and the target data is overwritten with the contents of the source data.
]()

[SWS_Csm_91021] [If the current length of the target key element is lower than (keyElementTargetOffset + keyElementCopyLength) and the maximum length of the key element is greater or equal than (keyElementTargetOffset + keyElementCopyLength), then the source data shall be copied into the target key element and the length shall be set to (keyElementTargetOffset + keyElementCopyLength).
]()

[SWS_Csm_91022] [If the maximum length of the target key element is lower than (keyElementTargetOffset + keyElementCopyLength) then the copy operation shall not be performed and the function shall return with the error code CRYPTO_E_KEY_SIZE_MISMATCH.
]()

8.3.8.5 Key Generation interface

The key generation interface is used to generate a key into the key element CRYPTO_KE_KEYGENERATE_KEY according to the algorithm defined in the key element CRYPTO_KE_KEYGENERATE_ALGORITHM.

The key will be generated from the random value that is located in the key element CRYPTO_KE_KEYGENERATE_SEED.

The random value can be generated, for example, with the function `Csm_RandomGenerate()` and must be stored in `CRYPTO_KE_KEYGENERATE_SEED` before the key generation is triggered. It is important to check the quality of the randomness and its entropy of the seed, which depends on the used hardware, and software of a stack. The randomness has a major impact on the quality of the generated key material.

The key element with the `id=CRYPTO_KE_KEYGENERATE_ALGORITHM` contains a type from "Crypto_AlgorithmFamilyType", e.g. `CRYPTO_ALGOFAM_AES`, `CRYPTO_ALGOFAM_RSA` or `CRYPTO_ALGOFAM_ED25519`, that allows to generate an adequate key.

As a counter example, the algorithm family type `CRYPTO_ALGOFAM_SHA2_256` is not adequate because it provides no hint what key shall be generated.

For the key element `CRYPTO_KE_KEYGENERATE_KEY` the key element configuration item `CryptoKeyElement/CryptoKeyElementFormat` indicates the format of the generated key.

8.3.8.5.1 Csm_RandomSeed

[SWS_Csm_01051][

Service Name	Csm_RandomSeed	
Syntax	<pre>Std_ReturnType Csm_RandomSeed (uint32 keyId, const uint8* seedPtr, uint32 seedLength)</pre>	
Service ID [hex]	0x69	
Sync/Async	Synchronous	
Reentrancy	Reentrant, but not for same keyId	
Parameters (in)	keyId	Holds the identifier of the key for which a new seed shall be generated.
	seedPtr	Holds a pointer to the memory location which contains the data to feed the seed.
	seedLength	Contains the length of the seed in bytes.
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_Return-Type	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, Crypto Driver Object is busy CRYPTO_E_KEY_NOT_VALID: Request failed, the key's state is "invalid"
Description	Feeds the key element <code>CRYPTO_KE_RANDOM_SEED</code> with a random seed.	

Available via	Csm.h
----------------------	-------

]()

[SWS_Csm_01052] | If no errors are detected by Csm, the service Csm_RandomSeed() shall call CryIf_RandomSeed().
]()

8.3.8.5.2 Csm_KeyGenerate

[SWS_Csm_00955]|

Service Name	Csm_KeyGenerate	
Syntax	Std_ReturnType Csm_KeyGenerate (uint32 keyId)	
Service ID [hex]	0x6a	
Sync/Async	Synchronous	
Reentrancy	Reentrant but not for same keyId	
Parameters (in)	keyId	Holds the identifier of the key for which a new material shall be generated.
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, Crypto Driver Object is busy CRYPTO_E_KEY_NOT_VALID: Request failed, the key's state is "invalid" CRYPTO_E_KEY_EMPTY: Request failed because of uninitialized source key element
Description	Generates new key material and store it in the key identified by keyId.	
Available via	Csm.h	

] (SRS_CryptoStack_00026, SRS_CryptoStack_00027)

[SWS_Csm_01005] | If no errors are detected by Csm, the service Csm_KeyGenerate() shall call CryIf_KeyGenerate().
]()

8.3.8.6 Key Derivation Interface

In cryptography, a key derivation function (or KDF) is a function, which derives one or more secret keys from a secret value and/or other known information such as a passphrase or cryptographic key.

Specification of input keys that are protected by hardware means can be achieved by using the Csm_KeyDeriveKey interface.

8.3.8.6.1 Csm_KeyDerive

[SWS_Csm_00956]

Service Name	Csm_KeyDerive	
Syntax	<pre>Std_ReturnType Csm_KeyDerive (uint32 keyId, uint32 targetKeyId)</pre>	
Service ID [hex]	0x6b	
Sync/Async	Synchronous	
Reentrancy	Reentrant, but not for same keyId	
Parameters (in)	keyId	Holds the identifier of the key which is used for key derivation.
	targetKeyId	Holds the identifier of the key which is used to store the derived key.
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, Crypto Driver Object is busy CRYPTO_E_KEY_READ_FAIL: Request failed, not allowed to extract key element CRYPTO_E_KEY_WRITE_FAIL: Request failed, not allowed to write key element CRYPTO_E_KEY_NOT_VALID: Request failed, the key's state is "invalid" CRYPTO_E_KEY_SIZE_MISMATCH: Request failed, key element sizes are not compatible CRYPTO_E_KEY_EMPTY: Request failed because of uninitialized source key element
Description	Derives a new key by using the key elements in the given key identified by the keyId. The given key contains the key elements for the password and salt. The derived key is stored in the key element with the id 1 of the key identified by targetCryptoKeyId.	
Available via	Csm.h	

](SRS_CryptoStack_00103)**Csm_KeyGenerate**

[SWS_Csm_01018] | If no errors are detected by Csm, the service `Csm_KeyDerive()` shall call `CryIf_KeyDerive()`.
| ()

[SWS_Csm_01019] | If the number of iterations for the key derivation is needed by the Crypto Driver, it shall be stored in the key element `CRYPTO_KE_KEYDERIVATION_ITERATIONS`.
| ()

8.3.8.7 Key Exchange Interface

Two users that each have a private secret can use a key exchange protocol to obtain a common secret, e.g. a key for a symmetric-key algorithm, without telling each other their private secret and without any listener being able to obtain the common secret or their private secrets

The functions `Csm_KeyExchangeCalcPubVal()` / `Csm_JobKeyExchangeCalcPubVal()` and `Csm_KeyExchangeCalcSecret()` / `Csm_JobKeyExchangeCalcSecret()` are used to support Diffie-Hellman (DH) key exchange.

This allows two partners, Alice and Bob, to generate private and public key material, to exchange public parts so that both parties can generate at the end a common shared secret. This shared secret can further be used, e.g. for symmetric data operation such as data encryption or MAC generation.

The public and private key material can either be based on prime based large number as it is used with RSA or on elliptic curve (so-called elliptic-curve diffie-hellman).

The CSM key exchange functions require a key with key elements according to [SWS_Csm_01022], in the line of Crypto Service "Key Exchange". The key elements `CRYPTO_KE_KEYEXCHANGE_BASE`, `CRYPTO_KE_KEYEXCHANGE_PRIVKEY` and `CRYPTO_KE_KEYEXCHANGE_OWNPUBKEY` are used to hold the public/private key material.

These values can either be pre-defined and set by `Csm_KeyElementSet()` followed by `Csm_KeySetValid()` or generated. For example, these key values can be generated by `Csm_KeyGenerate()` and then copied with `Csm_KeyElementCopy()` to the corresponding key elements, followed by a call to `Csm_KeySetValid()`.

In a first step, Alice will call `Csm_KeyExchangeCalcPubVal()` / `Csm_JobKeyExchangeCalcPubVal()` and send the results to Bob (exchanged data may need to be signed and/or encrypted depending on the protocol).

It should be noted, that if `KeyExchangeCalcPubVal` is called but no valid key material exists (key is not valid or essential key elements have length=0), the function shall generate the necessary key material and continue as normal.

If needed, Bob will put received key material from Alice into the corresponding key elements. He will also call `Csm_KeyExchangeCalcPubVal()` to generate his shared value that needs to be sent to Alice. Afterwards, Bob can call

Csm_KeyExchangeCalcSecret() to generate the common secret. This value will be placed into the key element CRYPTO_KE_KEYEXCHANGE_SHAREDVALUE. When Alice receives the public value from Bob, it will call KeyExchangeCalcSecret() and provides the value from Bob in the parameter of the function. The common shared secret will be generated by this function into the key element CRYPTO_KE_KEYEXCHANGE_SHAREDVALUE. Depending on the algorithm, Bob needs to send key material to Alice to allow her to generate the common shared secret.

The key element CRYPTO_KE_KEYEXCHANGE_ALGORITHM specifies the Diffie-Hellman algorithm. The key element value is of type Crypto_AlgorithmFamily, for example CRYPTO_ALGOFAM_DH (for modulo based DH) or CRYPTO_ALGOFAM_ED25519 (for ECDH(E)). Additional elliptic curve parameter can be specified with the additional key element CRYPTO_KE_KEYEXCHANGE_CURVE.

The other key elements have the following meaning:

	DH(E)	ECDH(E)
CRYPTO_KE_KEYEXCHANGE_BASE	Modulo	Generator point
CRYPTO_KE_KEYEXCHANGE_PRIVKEY	Local exponent	Private key
CRYPTO_KE_KEYEXCHANGE_OWNPUBKEY	Generator	Public key

8.3.8.7.1 Csm_KeyExchangeCalcPubVal

[SWS_Csm_00966] |

Service Name	Csm_KeyExchangeCalcPubVal	
Syntax	<pre>Std_ReturnType Csm_KeyExchangeCalcPubVal (uint32 keyId, uint8* publicKeyPtr, uint32* publicKeyLengthPtr)</pre>	
Service ID [hex]	0x6c	
Sync/Async	Synchronous	
Reentrancy	Reentrant but not for same keyId	
Parameters (in)	keyId	Holds the identifier of the key which shall be used for the key exchange protocol.
Parameters (inout)	publicValueLengthPtr	Holds a pointer to the memory location in which the public value length information is stored. On calling this function, this parameter shall contain the size of the buffer provided by publicKeyPtr. When the request has finished, the actual length of the returned value shall be stored.
Parameters (out)	publicValuePtr	Contains the pointer to the data where the public value shall be stored.

Return value	Std_ReturnType	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, Crypto Driver Object is busy CRYPTO_E_KEY_NOT_VALID: Request failed, the key's state is "invalid" CRYPTO_E_KEY_EMPTY: Request failed because of uninitialized source key element
Description	Calculates the public value of the current user for the key exchange and stores the public key in the memory location pointed by the public value pointer.	
Available via	Csm.h	

](SRS_CryptoStack_00028)

[SWS_Csm_01020] If no errors are detected by Csm, the service

Csm_KeyExchangeCalcPubVal() shall call

CryIf_KeyExchangeCalcPubVal().

]()

8.3.8.7.2 Csm_KeyExchangeCalcSecret

[SWS_Csm_00967] [

Service Name	Csm_KeyExchangeCalcSecret	
Syntax	<pre>Std_ReturnType Csm_KeyExchangeCalcSecret (uint32 keyId, const uint8* partnerPublicValuePtr, uint32 partnerPublicValueLength)</pre>	
Service ID [hex]	0x6d	
Sync/Async	Synchronous	
Reentrancy	Reentrant but not for same keyId	
Parameters (in)	keyId	Holds the identifier of the key which shall be used for the key exchange protocol.
	partnerPublicValuePtr	Holds the pointer to the memory location which contains the partner's public value.
	partnerPublicValueLength	Contains the length of the partner's public value in bytes.
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, Crypto Driver Object is busy

	CRYPTO_E_KEY_NOT_VALID: Request failed, the key's state is "invalid" CRYPTO_E_KEY_EMPTY: Request failed because of uninitialized source key element
Description	Calculates the shared secret key for the key exchange with the key material of the key identified by the keyId and the partner public key. The shared secret key is stored as a key element in the same key.
Available via	Csm.h

] (SRS_CryptoStack_00028)

[SWS_Csm_01006] [If no errors are detected by Csm, the service Csm_KeyExchangeCalcSecret() shall call CryIf_KeyExchangeCalcSecret().
] ()

8.3.9 Cryptographic Primitives and Schemes

The keyId configured in the Job is only used to determine which driver objects needs to be used for the specific JobKeyPrimitive operation.

8.3.9.1 Csm_JobKeySetValid

[SWS_Csm_91027] [

Service Name	Csm_JobKeySetValid	
Syntax	<pre>Std_ReturnType Csm_JobKeySetValid (uint32 jobId, uint32 keyId)</pre>	
Service ID [hex]	0x7a	
Sync/Async	Sync or Async, depending on the job configuration	
Reentrancy	Reentrant	
Parameters (in)	jobId	Holds the identifier of the job using the CSM service.
	keyId	Holds the identifier of the key for which a new material shall be validated.
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, Crypro Driver Object is busy

Description	Stores the key if necessary and sets the key state of the key identified by keyId to valid.
Available via	Csm.h

]()

8.3.9.2 Csm_JobKeySetInvalid

[SWS_Csm_91002]

Service Name	Csm_JobKeySetInvalid	
Syntax	<pre>Std_ReturnType Csm_JobKeySetInvalid (uint32 jobId, uint32 keyId)</pre>	
Service ID [hex]	0x84	
Sync/Async	Synchronous or Async, depending on the job configuration	
Reentrancy	Reentrant	
Parameters (in)	jobId	Holds the identifier of the job using the CSM service.
	keyId	Holds the identifier of the key which shall be invalidated.
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, Crypro Driver Object is busy
Description	Sets the key status to invalid. The key cannot be used any longer for cryptographic operations until it has been set to valid state again.	
Available via	Csm.h	

]()

8.3.9.3 Csm_JobRandomSeed

[SWS_Csm_91028]

Service Name	Csm_JobRandomSeed
Syntax	<pre>Std_ReturnType Csm_JobRandomSeed (uint32 jobId, uint32 keyId, const uint8* seedPtr,</pre>

	uint32 seedLength)	
Service ID [hex]	0x7b	
Sync/Async	Synchronous or Async, depending on the job configuration	
Reentrancy	Reentrant	
Parameters (in)	jobId	Holds the identifier of the job using the CSM service.
	keyId	Holds the identifier of the key for which a new seed shall be generated.
	seedPtr	Holds a pointer to the memory location which contains the data to feed the seed.
	seedLength	Contains the length of the seed in bytes.
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_Return-Type	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, service is still busy CRYPTO_E_KEY_NOT_VALID: Request failed, the key's state is "invalid"
Description	Provides a new seed for the specified key that is used for an associated random number generator.	
Available via	Csm.h	

|()

Note: The provided key Id(s) shall be transformed from CsmKeyId's to CryIfKeyId's.

8.3.9.4 Csm_JobKeyGenerate

[SWS_Csm_91029]|

Service Name	Csm_JobKeyGenerate	
Syntax	Std_ReturnType Csm_JobKeyGenerate (uint32 jobId, uint32 keyId)	
Service ID [hex]	0x7c	
Sync/Async	Synchronous or Async, depending on the job configuration	
Reentrancy	Reentrant	
Parameters (in)	jobId	Holds the identifier of the job using the CSM service.

	keyId	Holds the identifier of the key for which a new material shall be generated.
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, service is still busy CRYPTO_E_KEY_NOT_VALID: Request failed, the key's state is "invalid" CRYPTO_E_KEY_EMPTY: Request failed because of uninitialized source key element
Description	Generates new key material and stores it in the key identified by keyId.	
Available via	Csm.h	

]()

Note: The provided key Id(s) shall be transformed from CsmKeyId's to CryIfKeyId's.

8.3.9.5 Csm_JobKeyDerive

[SWS_Csm_91030]

Service Name	Csm_JobKeyDerive	
Syntax	<pre>Std_ReturnType Csm_JobKeyDerive (uint32 jobId, uint32 keyId, uint32 targetKeyId)</pre>	
Service ID [hex]	0x7d	
Sync/Async	Synchronous or Async, depending on the job configuration	
Reentrancy	Reentrant	
Parameters (in)	jobId	Holds the identifier of the job using the CSM service.
	keyId	Holds the identifier of the key which is used for key derivation.
	targetKeyId	Holds the identifier of the key which is used to store the derived key.
Parameters (inout)	None	
Parameters (out)	None	

Return value	Std_ReturnType	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, service is still busy CRYPTO_E_KEY_READ_FAIL: Request failed, not allowed to extract key element CRYPTO_E_KEY_WRITE_FAIL: Request failed, not allowed to write key element CRYPTO_E_KEY_NOT_VALID: Request failed, the key's state is "invalid" CRYPTO_E_KEY_SIZE_MISMATCH: Request failed, key element sizes are not compatible CRYPTO_E_KEY_EMPTY: Request failed because of uninitialized source key element
Description	Derives a new key by using the key elements in the given key identified by the keyId. The given key contains the key elements for the password and salt. The derived key is stored in the key element with the id 1 of the key identified by targetCryptoKeyId.	
Available via	Csm.h	

]()

Note: The provided key Id(s) shall be transformed from CsmKeyId's to CryIfKeyId's.

8.3.9.6 Csm_JobKeyExchangeCalcPubVal

[SWS_Csm_91031][

Service Name	Csm_JobKeyExchangeCalcPubVal	
Syntax	<pre>Std_ReturnType Csm_JobKeyExchangeCalcPubVal (uint32 jobId, uint32 keyId, uint8* publicKeyPtr, uint32* publicKeyLengthPtr)</pre>	
Service ID [hex]	0x7e	
Sync/Async	Synchronous or Async, depending on the job configuration	
Reentrancy	Reentrant	
Parameters (in)	jobId	Holds the identifier of the job using the CSM service.
	keyId	Holds the identifier of the key which shall be used for the key exchange protocol.
Parameters (inout)	public Value LengthPtr	Holds a pointer to the memory location in which the public value length information is stored. On calling this function, this parameter shall contain the size of the buffer provided by publicKeyPtr. When the request has finished, the actual length of the returned value shall be stored.
Parameters (out)	public ValuePtr	Contains the pointer to the data where the public value shall be stored.

Return value	Std_ReturnType	E_OK: Request successful E_NOT_OK: Request failed CRYPTO_E_BUSY: Request failed, service is still busy CRYPTO_E_KEY_NOT_VALID: Request failed, the key's state is "invalid" CRYPTO_E_KEY_EMPTY: Request failed because of uninitialized source key element
Description	Calculates the public value of the current user for the key exchange and stores the public key in the memory location pointed by the public value pointer.	
Available via	Csm.h	

]()

Note: The provided key Id(s) shall be transformed from CsmKeyId's to CrylfKeyId's.

8.3.9.7 Csm_JobKeyExchangeCalcSecret

[SWS_Csm_91032]

Service Name	Csm_JobKeyExchangeCalcSecret	
Syntax	<pre>Std_ReturnType Csm_JobKeyExchangeCalcSecret (uint32 jobId, uint32 keyId, const uint8* partnerPublicValuePtr, uint32 partnerPublicValueLength)</pre>	
Service ID [hex]	0x7f	
Sync/Async	Synchronous or Async, depending on the job configuration	
Reentrancy	Reentrant	
Parameters (in)	jobId	Holds the identifier of the job using the CSM service.
	keyId	Holds the identifier of the key which shall be used for the key exchange protocol.
	partnerPublicValuePtr	Holds the pointer to the memory location which contains the partner's public value.
	partnerPublicValueLength	Contains the length of the partner's public value in bytes.
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: Request successful E_NOT_OK: Request failed

	CRYPTO_E_BUSY: Request failed, service is still busy CRYPTO_E_KEY_NOT_VALID: Request failed, the key's state is "invalid" CRYPTO_E_KEY_EMPTY: Request failed because of uninitialized source key element
Description	Calculates the shared secret key for the key exchange with the key material of the key identified by the keyId and the partner public key. The shared secret key is stored as a key element in the same key.
Available via	Csm.h

]()

Note: The provided key Id(s) shall be transformed from CsmKeyId's to CrylfKeyId's.

8.3.10 Context Save and Restore

8.3.10.1 Csm_SaveContextJob

[SWS_Csm_91063][

Service Name	Csm_SaveContextJob	
Syntax	<pre>Std_ReturnType Csm_SaveContextJob (uint32 jobId, uint8* contextBufferPtr, uint32* contextBufferLengthPtr)</pre>	
Service ID [hex]	0x86	
Sync/Async	Synchronous or asynchronous depending on the job configuration	
Reentrancy	Reentrant	
Parameters (in)	jobId	Holds the identifier of the job using the CSM service.
Parameters (inout)	context Buffer LengthPtr	Pointer to the buffer, where the length value is located. As input data it provides the maximum length of data available in contextBufferPtr. As output data it provides the actual length of data located in context BufferPtr (or 0 in case of a failure)
Parameters (out)	context BufferPtr	Pointer to the buffer in the application where the context data shall be stored to.
Return value	Std_-Return-Type	E_OK: Context data successfully provided. E_NOT_OK: Context data could not be provided; values are not valid. CRYPTO_E_BUSY: Request failed, service is still busy
Description	The Crypto Driver stores the internal context of the respective crypto operation to the contextBuffer.	
Available via	Csm.h	

]()

[SWS_Csm_91067] | If Csm_SaveContextJob() is called and the job is active, CSM shall put contextBufferPtr to job.PrimitiveInputOutput.outputPtr and contextOutputLengthPtr into job.PrimitiveInputOutput.outputLengthPtr, set job->jobPrimitiveInputOutput->mode to CRYPTO_OPERATIONMODE_SAVE_CONTEXT and call CryIf_ProcessJob() with the corresponding ChannelId of this job and a pointer to the job itself. Any return value from this function call shall be provided back to the application.

]()

8.3.10.2 Csm_RestoreContextJob

[SWS_Csm_91064] |

Service Name	Csm_RestoreContextJob	
Syntax	<pre>Std_ReturnType Csm_RestoreContextJob (uint32 jobId, uint8* contextBufferPtr, uint32 contextBufferLength)</pre>	
Service ID [hex]	0x87	
Sync/Async	Synchronous or asynchronous depending on the job configuration	
Reentrancy	Reentrant	
Parameters (in)	jobId	Holds the identifier of the job where context shall be requested from.
	contextBufferPtr	Pointer to the buffer, where the context data are located that shall be restored.
	contextBufferLength	Provides the length of context data that are located in context BufferPtr.
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: Context data successfully restored. E_NOT_OK: Context data could not be restored. CRYPTO_E_BUSY: Request failed, service is still busy
Description	The Crypto Driver extracts the context data from the contextBuffer and restores the internal state so that further crypto operation of this crypto service will continue at the exact point when the context was taken.	
Available via	Csm.h	

]()

[SWS_Csm_91068] | If Csm_RestoreContextJob () is called and the job is active, CSM shall put contextBufferPtr into job.PrimitiveInputOutput.inputPtr and contextBufferLength into job.PrimitiveInputOutput.inputLength, set job->jobPrimitiveInputOutput->mode to CRYPTO_OPERATIONMODE_RESTORE_CONTEXT and call CryIf_ProcessJob () with the corresponding ChannelId of this job and a pointer to the job itself. Any return value from this function call shall be provided back to the application.

]()

8.3.11 Job Cancellation Interface

8.3.11.1 Csm_CancelJob

[SWS_Csm_00968] |

Service Name	Csm_CancelJob	
Syntax	Std_ReturnType Csm_CancelJob (uint32 job, Crypto_OperationModeType mode)	
Service ID [hex]	0x6f	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	job	Holds the identifier of the job to be canceled
	mode	Not used, just for interface compatibility provided.
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_-Return-Type	E_OK: Request successful. Job removed from any queue and potentially from crypto driver hardware. E_NOT_OK: Request failed CRYPTO_E_JOB_CANCELED: Immediate cancelation not possible. The cancelation will be done at next suitable processing step and notified via a negative job's closing callback.
Description	Cancels the job processing from asynchronous or streaming jobs.	
Available via	Csm.h	

]()

[SWS_Csm_01086] | If development error detection for the CSM is enabled: The function `Csm_CancelJob()` shall raise the error `CSM_E_PROCESSING_MODE` and return `E_NOT_OK` if the `Csm_CancelJob()` is called for a synchronous job.
| ()

[SWS_Csm_01021] | The Csm shall remove the job from its own queue or call `CryIf_CancelJob()` to cancel a potential job in the driver.| ()

[SWS_Csm_01030] | In case the `CryIf_CancelJob()` returns `E_OK`, the job's closing callback `CallbackNotification` shall be called with a result value of `CRYPTO_E_JOB_CANCELED`.

| ()

[SWS_Csm_01087] | In case the `CryIf_CancelJob()` returns `CRYPTO_E_JOB_CANCELED` (i.e. the job was not instantly canceled) the CSM shall postpone the call of the job's closing callback until the next call of `Csm_CallbackNotification()`. The result of the job's closing callback shall be `CRYPTO_E_JOB_CANCELED`.

| ()

Note: In case the crypto driver does not support an instant cancellation of the job, the application need to wait for the job's closing callback to free the buffers. The crypto driver could potentially still write to the output buffer(s).

8.3.12 Callback Notifications

8.3.12.1 Csm_CallbackNotification

[SWS_Csm_00970] |

Service Name	Csm_CallbackNotification	
Syntax	<pre>void Csm_CallbackNotification (Crypto_JobType* job, Crypto_ResultType result)</pre>	
Service ID [hex]	0x70	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	job	Holds a pointer to the job, which has finished.
	result	Contains the result of the cryptographic operation.
Parameters (inout)	None	
Parameters (out)	None	

Return value	None
Description	Notifies the CSM that a job has finished. This function is used by the underlying layer (CRYIF).
Available via	Csm.h

] (SRS_BSW_00359, SRS_BSW_00360)

[SWS_Csm_01044] If the CRYPTO_OPERATIONMODE_FINISH bit is set in job->jobPrimitiveInputOutput.mode, the Csm_CallbackNotification shall call the configured callback function.

]()

[SWS_Csm_91017] If the CRYPTO_OPERATIONMODE_FINISH bit is set in job->jobPrimitiveInputOutput.mode and CsmProcessingMode is set to CRYPTO_PROCESSING_ASYNC and CsmJobInterfaceUsePort is set to CRYPTO_USE_PORT_OPTIMIZED, the CSM shall trigger CallbackNotification service.

]()

8.3.13 Scheduled functions

8.3.13.1 Csm_MainFunction

[SWS_Csm_00479]

Service Name	Csm_MainFunction
Syntax	void Csm_MainFunction (void)
Service ID [hex]	0x01
Description	API to be called cyclically to process the requested jobs. The Csm_MainFunction shall check the queues for jobs to pass to the underlying CRYIF. Per configured Csm MainFunction instance one Csm_MainFunction_<shortName> shall be implemented. Hereby <shortName> is the short name of the CsmMainFunction configuration container in the ECU configuration.
Available via	SchM_Csm.h

] (SRS_BSW_00373, SRS_BSW_00432)

8.4 Expected Interfaces

8.4.1 Interfaces to Standard Software Modules

8.4.2 Mandatory Interfaces

[SWS_Csm_91100][

<i>API Function</i>	<i>Header File</i>	<i>Description</i>
CryIf_CancelJob	CryIf.h	This interface dispatches the job cancellation function to the configured crypto driver object.
CryIf_KeyCopy	CryIf.h	This function shall copy all key elements from the source key to a target key.
CryIf_Key-ElementCopy	CryIf.h	This function shall copy a key elements from one key to a target key.
CryIf_Key-ElementCopy-Partial	CryIf.h	Copies a key element to another key element. The keyElementOffsets and keyElementCopyLength allows to copy just parts of the source key element into the destination key element.
CryIf_Key-ElementGet	CryIf.h	This function shall dispatch the get key element function to the configured crypto driver object.
CryIf_Key-ElementSet	CryIf.h	This function shall dispatch the set key element function to the configured crypto driver object.
CryIf_Key-ExchangeCalc-Secret	CryIf.h	This function shall dispatch the key exchange common shared secret calculation function to the configured crypto driver object.
CryIf_Key-Generate	CryIf.h	This function shall dispatch the key generate function to the configured crypto driver object.
CryIf_KeySet-Valid	CryIf.h	This function shall dispatch the set key valid function to the configured crypto driver object.
CryIf_Process-Job	CryIf.h	This interface dispatches the received jobs to the configured crypto driver object.
CryIf_Random-Seed	CryIf.h	This function shall dispatch the random seed function to the configured crypto driver object.
Det_Report-RuntimeError	Det.h	Service to report runtime errors. If a callout has been configured then this callout shall be called.

]()

8.4.3 Optional Interfaces

[SWS_Csm_91101][

<i>API Function</i>	<i>Header File</i>	<i>Description</i>
---------------------	--------------------	--------------------

Det_ReportError	Det.h	Service to report development errors.
-----------------	-------	---------------------------------------

]()

8.4.4 Configurable interfaces

8.4.4.1 <Csm_ApplicationCallbackNotification>

[SWS_Csm_00971]

Service Name	<Csm_ApplicationCallbackNotification>	
Syntax	void <Csm_ApplicationCallbackNotification> (uint32 jobId, Crypto_ResultType result)	
Service ID [hex]	0x82	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	jobId	JobID of the operation that caused the callback
	result	Contains the result of the cryptographic operation.
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	CSM notifies the application that a job has finished. The function name is configurable. The function name itself is derived from "{CsmJob/CsmJobPrimitive CallbackRef}/CsmCallbackFunc".	
Available via	Csm.h	

] (SRS_BSW_00359, SRS_BSW_00360)

[SWS_Csm_01090] Csm_ApplicationCallbackNotification shall be called once at the end when an asynchronous job's call has been finished, i.e. the given operation mode has been completely processed, the job has been aborted due to an error or the the job has been cancelled. Thus, if a job's call processed multiple operation modes, i.e. CRYPTO_OPERATIONMODE_STREAMSTART or CRYPTO_OPERATIONMODE_SINGLECALL, Csm_ApplicationCallbackNotification is called only once.

]()

[SWS_Csm_01095] | The CSM shall call the application callback function if the following condition is met:

```
({ecuc(Csm/CsmJobs/CsmJob.CsmProcessingMode) } == CRYPTO_PROCESSING_ASYNC) &&
(CsmJob/CsmJobInterfaceUsePort == CRYPTO_USE_FNC) &&
(CsmJob/CsmJobPrimitiveCallbackRef != 0)
```

For the service interface the callback service shall be called if the asynchronous processing is configured:

```
({ecuc(Csm/CsmJobs/CsmJob.CsmProcessingMode) } == CRYPTO_PROCESSING_ASYNC) &&
(CsmJob/CsmJobInterfaceUsePort != CRYPTO_USE_FNC)
```

|()

8.5 Service Interface

This chapter is an addition to the specification of the Csm module. Whereas the other parts of the specification define the behavior and the C-interfaces of the corresponding basic software module, this chapter formally specifies the corresponding AUTOSAR service in terms of the SWC template. The interfaces described here will be visible on the VFB and are used to generate the RTE between application software and the Csm module.

8.5.1 Client-Server-Interfaces

8.5.1.1 CsmKeyManagement_{Key}

[SWS_Csm_01905] |

Name	CsmKeyManagement_{Key}	
Comment	Interface to execute the key management functions.	
IsService	true	
Variation	{(ecuc(Csm/CsmKeys/CsmKey.CsmKeyUsePort)} == TRUE) Key = {ecuc(Csm/CsmKeys/CsmKey.SHORT-NAME)}	
Possible Errors	0	E_OK Operation successful
	1	E_NOT_OK Operation failed
	2	CRYPTO_E_BUSY Request failed, service is still busy.
	6	CRYPTO_E_KEY_READ_FAIL The service request failed because read access was denied.
	7	CRYPTO_E_KEY_WRITE_FAIL The service request failed because write access was denied.
	8	CRYPTO_E_KEY_NOT_AVAILABLE The service request failed because the key is not available.

	9	CRYPTO_E_KEY_NOT_VALID	Request failed, the key is not valid.
	10	CRYPTO_E_KEY_SIZE_MISMATCH	Request failed because the key element is not partially accessible and the provided key element length is too short or too long for that key element.
	13	CRYPTO_E_KEY_EMPTY	The service request failed because of uninitialized source key element.

Operation	KeyCopy		
Comment	This function shall copy all key elements from the source key to a target key.		
Variation	--		
Parameters	targetKeyId		
	Type	uint32	
	Direction	IN	
	Comment	Holds the identifier of the key whose key element shall be the destination element.	
	Variation	--	
Possible Errors	E_OK E_NOT_OK CRYPTO_E_BUSY CRYPTO_E_KEY_READ_FAIL CRYPTO_E_KEY_WRITE_FAIL CRYPTO_E_KEY_NOT_AVAILABLE CRYPTO_E_KEY_SIZE_MISMATCH CRYPTO_E_KEY_EMPTY		

Operation	KeyDerive		
Comment	Derives a new key by using the key elements in the given key. The given key contains the key elements for the password and salt. The derived key is stored in the key element with the id 1 of the key identified by targetCryptoKeyId.		
Variation	--		
Parameters	targetKeyId		
	Type	uint32	
	Direction	IN	
	Comment	Holds the identifier of the key which is used to store the derived key.	
	Variation	--	
Possible Errors	E_OK E_NOT_OK CRYPTO_E_BUSY

--	---

Operation	KeyElementCopy
Comment	This function shall copy a key elements from one key to a target key
Variation	--
Parameters	keyElementId
	Type uint32
	Direction IN
	Comment Holds the identifier of the key element which shall be the source for the copy operation.
	Variation --
	targetKeyId
	Type uint32
	Direction IN
	Comment Holds the identifier of the key whose key element shall be the destination element.
	Variation --
Possible Errors	targetKeyElementId
	Type uint32
	Direction IN
	Comment Holds the identifier of the key element which shall be the destination for the copy operation.
	Variation --
E_OK E_NOT_OK CRYPTO_E_BUSY CRYPTO_E_KEY_READ_FAIL CRYPTO_E_KEY_WRITE_FAIL CRYPTO_E_KEY_NOT_AVAILABLE CRYPTO_E_KEY_SIZE_MISMATCH CRYPTO_E_KEY_EMPTY	

Operation	KeyElementCopyPartial
Comment	This function shall copy parts of a key elements from one key to parts of a target key element of a target key.

Variation	--
Parameters	keyElementId
	Type uint32
	Direction IN
	Comment Holds the identifier of the key element which shall be the source for the copy operation.
	Variation --
	keyElementSourceOffset
	Type uint32
	Direction IN
	Comment This is the offset of the source key element indicating the start index of the copy operation.
	Variation --
keyElementTargetOffset	keyElementTargetOffset
	Type uint32
	Direction IN
	Comment This is the offset of the destination key element indicating the start index of the copy operation.
	Variation --
	keyElementCopyLength
	Type uint32
	Direction IN
	Comment Specifies the number of bytes that shall be copied.
	Variation --
targetKeyId	targetKeyId
	Type uint32
	Direction IN
	Comment Holds the identifier of the key whose key element shall be the destination element.
	Variation --
	targetKeyElementId
	Type uint32
	Direction IN

	Comment	Holds the identifier of the key element which shall be the destination for the copy operation.
	Variation	--
Possible Errors	E_OK E_NOT_OK CRYPTO_E_BUSY CRYPTO_E_KEY_READ_FAIL CRYPTO_E_KEY_WRITE_FAIL CRYPTO_E_KEY_NOT_AVAILABLE CRYPTO_E_KEY_SIZE_MISMATCH CRYPTO_E_KEY_EMPTY	

	Operation	KeyElementGet
	Comment	Retrieves the key element bytes from a specific key element of the key and stores the key element in the provided buffer.
	Variation	--
Parameters	keyElementId	
	Type	uint32
	Direction	IN
	Comment	Holds the identifier of the key element to be read.
	Variation	--
	keyElement	
	Type	Csm_KeyDataType_{Crypto}
	Direction	OUT
	Comment	Holds the data to the key element bytes to be written.
	Variation	--
	keyElementLength	
	Type	uint32
	Direction	INOUT
	Comment	Contains the number of key element bytes.
	Variation	--
Possible Errors	E_OK E_NOT_OK CRYPTO_E_BUSY CRYPTO_E_KEY_READ_FAIL CRYPTO_E_KEY_NOT_AVAILABLE CRYPTO_E_KEY_EMPTY	

Operation	KeyElementSet	
Comment	Sets the given key element bytes to the key.	
Variation	--	
	keyElementId	
Parameters	Type	uint32
	Direction	IN
	Comment	Holds the identifier of the key element to be written.
	Variation	--
	keyElement	
	Type	Csm_KeyDataType_{Crypto}
	Direction	IN
	Comment	Holds the data to the key element bytes to be processed.
	Variation	--
	keyElementLength	
	Type	uint32
	Direction	IN
	Comment	Contains the number of key element bytes.
	Variation	--
Possible Errors	E_OK E_NOT_OK CRYPTO_E_BUSY CRYPTO_E_KEY_WRITE_FAIL CRYPTO_E_KEY_NOT_AVAILABLE CRYPTO_E_KEY_SIZE_MISMATCH	

Operation	KeyExchangeCalcPubVal	
Comment	Calculates the public value of the current user for the key exchange and stores the public key in the provided buffer	
Variation	--	
	publicValue	
Parameters	Type	Csm_KeyDataType_{Crypto}
	Direction	OUT
	Comment	Contains the pointer to the memory location where the public value shall be stored.
	Variation	--

	publicValueLength
Type	uint32
Direction	INOUT
Comment	Holds a pointer to the memory location in which the public value length in bytes is stored. On calling this function, this parameter shall contain the size of the buffer in bytes provided by publicValuePtr. When the request has finished, the actual length of the returned value shall be stored.
Variation	--
Possible Errors	E_OK E_NOT_OK CRYPTO_E_BUSY CRYPTO_E_KEY_NOT_VALID CRYPTO_E_KEY_EMPTY

Operation	KeyExchangeCalcSecret	
Comment	Calculates the shared secret key for the key exchange with the key material of the key identified by the keyId and the partner public key. The shared secret key is stored as a key element in the same key.	
Variation	--	
Parameters	partnerPublicValue Type Csm_KeyDataType_{Crypto} Direction IN Comment Holds the pointer to the memory location containing the partner's public value Variation --	
	partnerPublicValueLength Type uint32 Direction IN Comment Contains the number of bytes of the partner pulic value Variation --	
Possible Errors	E_OK E_NOT_OK CRYPTO_E_BUSY CRYPTO_E_KEY_NOT_VALID CRYPTO_E_KEY_EMPTY	

Operation	KeyGenerate
Comment	Generates new key material and store it in the key identified by keyId.

Variation	--
Possible Errors	E_OK E_NOT_OK CRYPTO_E_BUSY CRYPTO_E_KEY_NOT_VALID CRYPTO_E_KEY_EMPTY

Operation	KeyGetStatus	
Comment	Returns the key state of the key identified by keyId.	
Variation	--	
Parameters	keyStatusPtr Type Crypto_KeyStatusType Direction OUT Comment Holds the status of the key referenced by the port. Variation --	
Possible Errors	E_OK E_NOT_OK	

Operation	KeySetInvalid	
Comment	Operation to set the status of the key to invalid.	
Variation	--	
Possible Errors	E_OK E_NOT_OK CRYPTO_E_BUSY	

Operation	KeySetValid	
Comment	Sets the given key element bytes to the key.	
Variation	--	
Possible Errors	E_OK E_NOT_OK CRYPTO_E_BUSY	

Operation	RandomSeed	
Comment	Feeds the key element CRYPTO_KE_RANDOM_SEED with a random seed.	
Variation	--	
Parameters	seed	
	Type	Csm_KeyDataType_{Crypto}

Possible Errors	Direction	IN
	Comment	Holds the data which shall be used for the random seed initialization.
	Variation	--
	seedLength	
	Type	uint32
	Direction	IN
	Comment	Contains the length of the seed in bytes.
	Variation	--
	E_OK E_NOT_OK CRYPTO_E_BUSY CRYPTO_E_KEY_NOT_VALID CRYPTO_E_KEY_EMPTY

8.5.2 Client-Server-Interfaces (DATA_REFERENCES)

8.5.2.1 CsmHash

[SWS_Csm_91051][

Name	CsmHash		
Comment	Asynchronous processing interface to execute the hash calculation.		
IsService	true		
Variation	Primitive = {ecuc(Csm/CsmPrimitives.SHORT-NAME)}		
Possible Errors	0	E_OK	Operation successful
	1	E_NOT_OK	Operation failed
	2	CRYPTO_E_BUSY	Request failed, service is still busy.
	12	CRYPTO_E_JOB_CANCELED	Request failed because the job has been canceled.

Operation	CancelJob	
Comment	Cancels the job.	
Variation	--	
Possible Errors	E_OK E_NOT_OK CRYPTO_E_JOB_CANCELED	

Operation	Hash	
Comment	Utilize the random seed service.	
Variation	--	
Parameters	dataPtr	
	Type	ConstVoidPtr
	Direction	IN
	Comment	References the data to be hashed.
	Variation	--
	dataLength	
	Type	uint32
	Direction	IN
	Comment	Contains the length in bytes of the data to be hashed.
	Variation	--

	resultPtr	
Type	VoidPtr	
Direction	IN	
Comment	References the data of the hash.	
Variation	--	
	resultLengthPtr	
Type	Csm_LengthPtr	
Direction	IN	
Comment	Contains the length in bytes of the hash.	
Variation	--	
Possible Errors	E_OK E_NOT_OK CRYPTO_E_BUSY	

] (SRS_CryptoStack_00090)

8.5.2.2 CsmMacGenerate

[SWS_Csm_91052][

Name	CsmMacGenerate	
Comment	Asynchronous processing interface to execute the MAC generation.	
IsService	true	
Variation	Primitive = {ecuc(Csm/CsmPrimitives.SHORT-NAME)}	
Possible Errors	0	E_OK Operation successful
	1	E_NOT_OK Operation failed
	2	CRYPTO_E_BUSY Request failed, service is still busy.
	9	CRYPTO_E_KEY_NOT_VALID Request failed, the key is not valid.
	10	CRYPTO_E_KEY_SIZE_MISMATCH Request failed because the key element is not partially accessible and the provided key element length is too short or too long for that key element.
	12	CRYPTO_E_JOB_CANCELED Request failed because the job has been canceled.
	13	CRYPTO_E_KEY_EMPTY The service request failed because of uninitialized source key element.

Operation	CancelJob
------------------	-----------

Comment	Cancels the job.
Variation	--
Possible Errors	E_OK E_NOT_OK CRYPTO_E_JOB_CANCELED

Operation	MacGenerate
Comment	Uses the given data to perform a MAC generation and stores the MAC in the memory location pointed to by the MAC pointer.
Variation	--
Parameters	dataPtr
	Type ConstVoidPtr
	Direction IN
	Comment References the data from which a MAC shall be generated of.
	Variation --
	dataLength
	Type uint32
	Direction IN
	Comment Contains the length in bytes of the data from which a MAC shall be generated of.
	Variation --
macPtr	macPtr
	Type VoidPtr
	Direction IN
	Comment References the data of the MAC.
	Variation --
	macLengthPtr
	Type Csm_LengthPtr
	Direction IN
	Comment Contains the length in bytes of the MAC.

8.5.2.6 CsmAEADEncrypt

[SWS_Csm_91056]

Name	CsmAEADEncrypt	
Comment	Asynchronous processing interface to execute the AEAD encryption.	
IsService	true	
Variation	Primitive = {ecuc(Csm/CsmPrimitives.SHORT-NAME)}	
Possible Errors	0	E_OK Operation successful
	1	E_NOT_OK Operation failed
	2	CRYPTO_E_BUSY Request failed, service is still busy.
	9	CRYPTO_E_KEY_NOT_VALID Request failed, the key is not valid.
	10	CRYPTO_E_KEY_SIZE_MISMATCH Request failed because the key element is not partially accessible and the provided key element length is too short or too long for that key element.
	12	CRYPTO_E_JOB_CANCELED Request failed because the job has been canceled.
	13	CRYPTO_E_KEY_EMPTY The service request failed because of uninitialized source key element.

Operation	AEADEncrypt	
Comment	Streaming approach of the AEAD encryption.	
Variation	--	
Parameters	plaintextPtr	
	Type	ConstVoidPtr
	Direction	IN
	Comment	References the plaintext to be encrypted with AEAD.

	Variation	--
plaintextLength		
	Type	uint32
	Direction	IN
	Comment	This element Contains the length in bytes of the plaintext to be encrypted with AEAD.
	Variation	--
associatedDataPtr		
	Type	ConstVoidPtr
	Direction	IN
	Comment	References the data of the header (that is not part of the encryption but authentication).
	Variation	--
associatedDataLength		
	Type	uint32
	Direction	IN
	Comment	Contains the length in bytes of the data of the header.
	Variation	--
ciphertextPtr		
	Type	VoidPtr
	Direction	IN
	Comment	References the data of the AEAD cipher.
	Variation	--
ciphertextLengthPtr		
	Type	Csm_LengthPtr
	Direction	IN
	Comment	Contains the length in bytes of the data of the AEAD cipher.
	Variation	--
tagPtr		
	Type	VoidPtr
	Direction	IN
	Comment	References the data of the Tag.

	Variation	--
	tagLengthPtr	
	Type	Csm_LengthPtr
	Direction	IN
	Comment	Contains the length in bytes of the data of the Tag.
	Variation	--
Possible Errors	E_OK E_NOT_OK CRYPTO_E_BUSY CRYPTO_E_KEY_NOT_VALID CRYPTO_E_KEY_SIZE_MISMATCH CRYPTO_E_KEY_EMPTY	

Operation	CancelJob
Comment	Cancels the job.

8.5.3.6 CsmJobKeyExchangeCalcPubVal

[SWS_Csm_91039]

Name	CsmJobKeyExchangeCalcPubVal		
Comment	Interface to execute calculation of the public value for key exchange.		
IsService	true		
Variation	Primitive = {ecuc(Csm/CsmPrimitives.SHORT-NAME)}		
Possible Errors	0	E_OK	Operation successful
	1	E_NOT_OK	Operation failed
	2	CRYPTO_E_BUSY	Request failed, service is still busy.
	9	CRYPTO_E_KEY_NOT_VALID	Request failed, the key is not valid.
	12	CRYPTO_E_JOB_CANCELED	Request failed because the job has been canceled.
	13	CRYPTO_E_KEY_EMPTY	The service request failed because of uninitialized source key element.

Operation	CancelJob
Comment	Cancels the job.

Variation	--
Possible Errors	E_OK E_NOT_OK CRYPTO_E_JOB_CANCELED

Operation	KeyExchangeCalcPubVal	
Comment	Calculates the public value of the current user for the key exchange and stores the public key in the provided buffer.	
Variation	--	
Parameters	keyId	
	Type	uint32
	Direction	IN
	Comment	Identifier of the key.
	Variation	--
	publicValuePtr	
	Type	VoidPtr
	Direction	IN
	Comment	Contains the pointer to the memory location where the public value shall be stored.
	Variation	--
Parameters	publicValueLengthPtr	
	Type	Csm_LengthPtr
	Direction	IN
	Comment	Holds a pointer to the memory location in which the public value length in bytes is stored. On calling this function, this parameter shall contain the size of the buffer in bytes provided by publicValuePtr. When the request has finished, the actual length of the returned value shall be stored.
Possible Errors	Variation	--
	E_OK E_NOT_OK CRYPTO_E_BUSY CRYPTO_E_KEY_NOT_VALID CRYPTO_E_KEY_EMPTY	

]()

8.5.3.7 CsmJobKeyExchangeCalcSecret

[SWS_Csm_91040] [

Name	CsmJobKeyExchangeCalcSecret		
Comment	Interface to execute calculation of shared secret for key exchange.		
IsService	true		
Variation	Primitive = {ecuc(Csm/CsmPrimitives.SHORT-NAME)}		
Possible Errors	0	E_OK	Operation successful
	1	E_NOT_OK	Operation failed
	2	CRYPTO_E_BUSY	Request failed, service is still busy.
	9	CRYPTO_E_KEY_NOT_VALID	Request failed, the key is not valid.
	12	CRYPTO_E_JOB_CANCELED	Request failed because the job has been canceled.
	13	CRYPTO_E_KEY_EMPTY	The service request failed because of uninitialized source key element.

Operation	CancelJob
Comment	Cancels the job.
Variation	--
Possible Errors	E_OK E_NOT_OK CRYPTO_E_JOB_CANCELED

Operation	KeyExchangeCalcSecret	
Comment	Calculates the shared secret key for the key exchange with the key material of the key identified by the keyId and the partner public key. The shared secret key is stored as a key element in the same key.	
Variation	--	
Parameters	keyId	
	Type	uint32
	Direction	IN
	Comment	Identifier of the key.
	Variation	--
	partnerPublicKeyPtr	
	Type	Csm_KeyDataType_{Crypto}
	Direction	IN

	Comment	Holds the pointer to the memory location containing the partner's public value.
	Variation	--
	partnerPublicValueLength	
	Type	uint32
	Direction	IN
	Comment	Contains the number of bytes of the partner public value.
	Variation	--
Possible Errors	E_OK E_NOT_OK CRYPTO_E_BUSY CRYPTO_E_KEY_NOT_VALID CRYPTO_E_KEY_EMPTY

Possible Errors	0	E_OK	Operation successful
	1	E_NOT_OK	Operation failed
	2	CRYPTO_E_BUSY	Request failed, service is still busy.

Operation	RestoreContextJob		
Comment	Restore the job context.		
Variation	--		
	contextBuffer		
Parameters	Type	VoidPtr	
	Direction	IN	

	Comment	Provides the buffer for the context as [DATA_REFERENCE].
	Variation	--
	contextBufferLength	
	Type	uint32
	Direction	IN
	Comment	Contains the length in bytes of the context buffer.
	Variation	--
Possible Errors	E_OK E_NOT_OK CRYPTO_E_BUSY	

Operation	SaveContextJob	
Comment	Save the job context to the provided buffer.	
Variation	--	
Parameters	contextBufferPtr	
	Type	VoidPtr
	Direction	IN
	Comment	Provides the buffer for the context as [DATA_REFERENCE].
	Variation	--
	contextBufferLengthPtr	
	Type	uint32
	Direction	IN
	Comment	Contains the length in bytes of the context buffer as [DATA_REFERENCE].

8.5.6 Implementation Data Types

8.5.6.1 Crypto_OperationModeType

[SWS_Csm_01029][

Name	Crypto_OperationModeType		
Kind	Enumeration		
Range	CRYPTO_OPERATIONMODE_START	0x01	Operation Mode is "Start". The job's state shall be reset, i.e. previous input data and intermediate results shall be deleted.
	CRYPTO_OPERATIONMODE_UPDATE	0x02	Operation Mode is "Update". Used to calculate intermediate results.
	CRYPTO_OPERATIONMODE_STREAMSTART	0x03	Operation Mode is "Stream Start". Mixture of "Start" and "Update". Used for streaming.
	CRYPTO_OPERATIONMODE_FINISH	0x04	Operation Mode is "Finish". The calculations shall be finalized.

	CRYPTO_OPERATIONMODE_SINGLECALL	0x07	Operation Mode is "Single Call". Mixture of "Start", "Update" and "Finish".
	CRYPTO_OPERATIONMODE_SAVE_CONTEXT	0x08	Operation mode is "Save workspace context". Context data shall be provided by the crypto driver to the application.
	CRYPTO_OPERATIONMODE_RESTORE_CONTEXT	0x10	Operation mode is "Restore workspace context". Application provides the context data that was previously stored and the crypto driver shall restore the internal workspace.
Description	Enumeration which operation shall be performed. This enumeration is constructed from a bit mask, where the first bit indicates "Start", the second "Update" and the third "Finish".		
Variation	--		
Available via	Rte_Csm_Type.h		

]()

8.5.6.2 Crypto_VerifyResultType

[SWS_Csm_01024][

Name	Crypto_VerifyResultType		
Kind	Enumeration		
Range	CRYPTO_E_VER_OK	0x00	The result of the verification is "true", i.e. the two compared elements are identical. This return code shall be given as value "0"
	CRYPTO_E_VER_NOT_OK	0x01	The result of the verification is "false", i.e. the two compared elements are not identical. This return code shall be given as value "1".
Description	Enumeration of the result type of verification operations.		
Variation	--		
Available via	Rte_Csm_Type.h

8.5.7.5 CsmContext_{Job}

[SWS_Csm_91105]

Name	CsmContext_{Job}		
Kind	ProvidedPort	Interface	CsmContextService_{Job}
Description	Port related to context data operation.		
Port Defined Argument Value(s)	Type	uint32	
	Value	{ecuc(Csm/CsmJobs/CsmJob.CsmJobId)}	
Variation	{ecuc(Csm/CsmJobs/CsmJob. CsmJobServiceInterfaceContextUsePort)} == CRYPTO_USE_PORT Job={ecuc(Csm/CsmJobs/CsmJob.SHORT-NAME)}		

] (SRS_CryptoStack_00090)

9 Sequence Diagrams

The following sequence diagrams concentrate on the interaction between the CSM module and software components respectively the ECU state manager.

9.1 Asynchronous Calls

The following diagram (Sequence diagram for asynchronous call) shows a sample sequence of function calls for a request performed asynchronously. The result of the asynchronous function can be accessed after an asynchronous notification (invocation of the configured callback function).

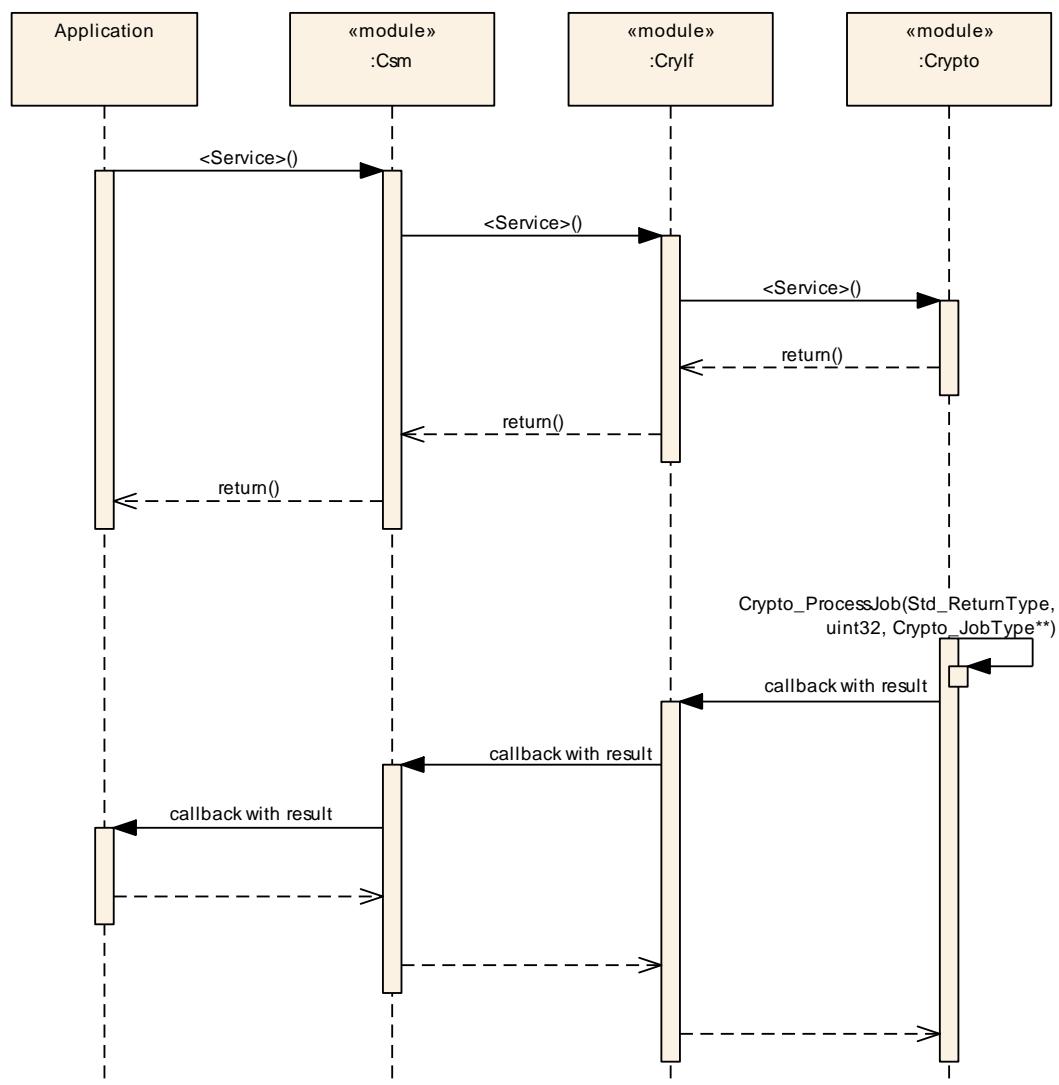

Figure 9-1 Sequence Diagram for Asynchronous Call with Callback

9.2 Synchronous Calls

The following diagram (Sequence diagram for synchronous calls) shows a sample sequence of function calls with the scheduler for a request performed synchronously.

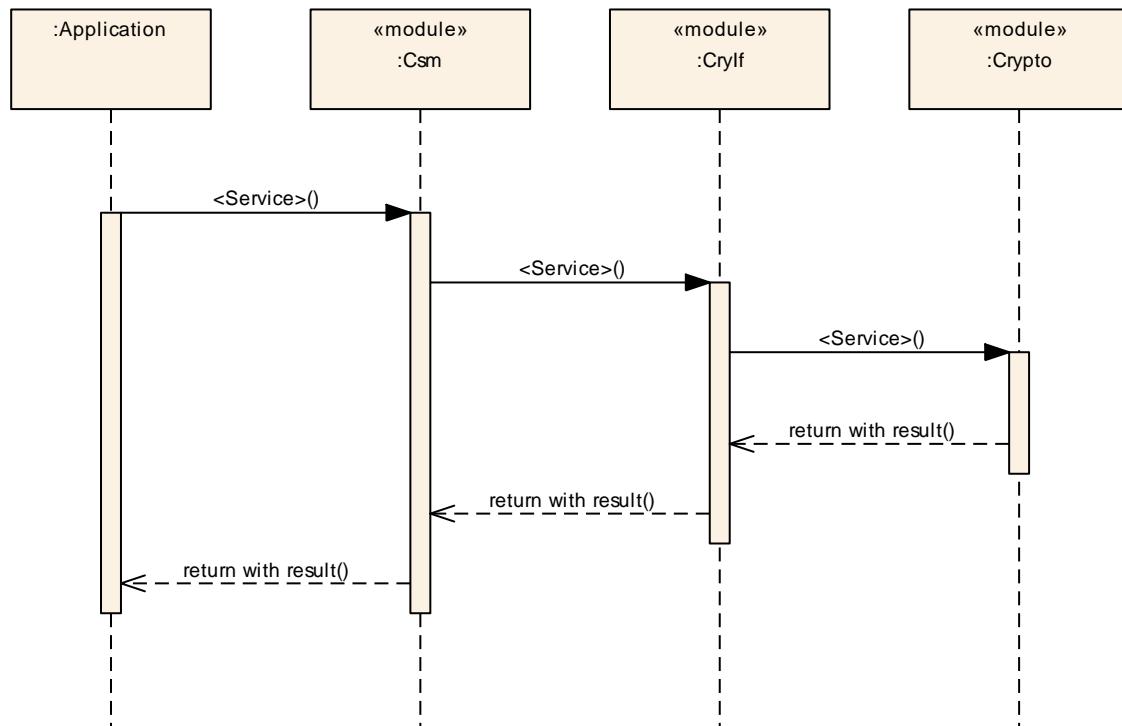

Figure 9-2 Sequence Diagram for Synchronous Call

10 Configuration

In general, this chapter defines configuration parameters and their clustering into containers. In order to support the specification Chapter 10.1 describes fundamentals. It also specifies a template (table) you shall use for the parameter specification.

Chapter 10.2 specifies the structure (containers) and the parameters of the module CSM.

Chapter 10.3 specifies published information of the module CSM.

10.1 How to Read this Chapter

For details refer to the chapter 10.1 “Introduction to configuration specification” in *SWS_BSWGeneral*.

10.2 Containers and Configuration Parameters

The following chapters summarize all configuration parameters. The detailed meanings of the parameters describe Chapters 7 and Chapter 8.

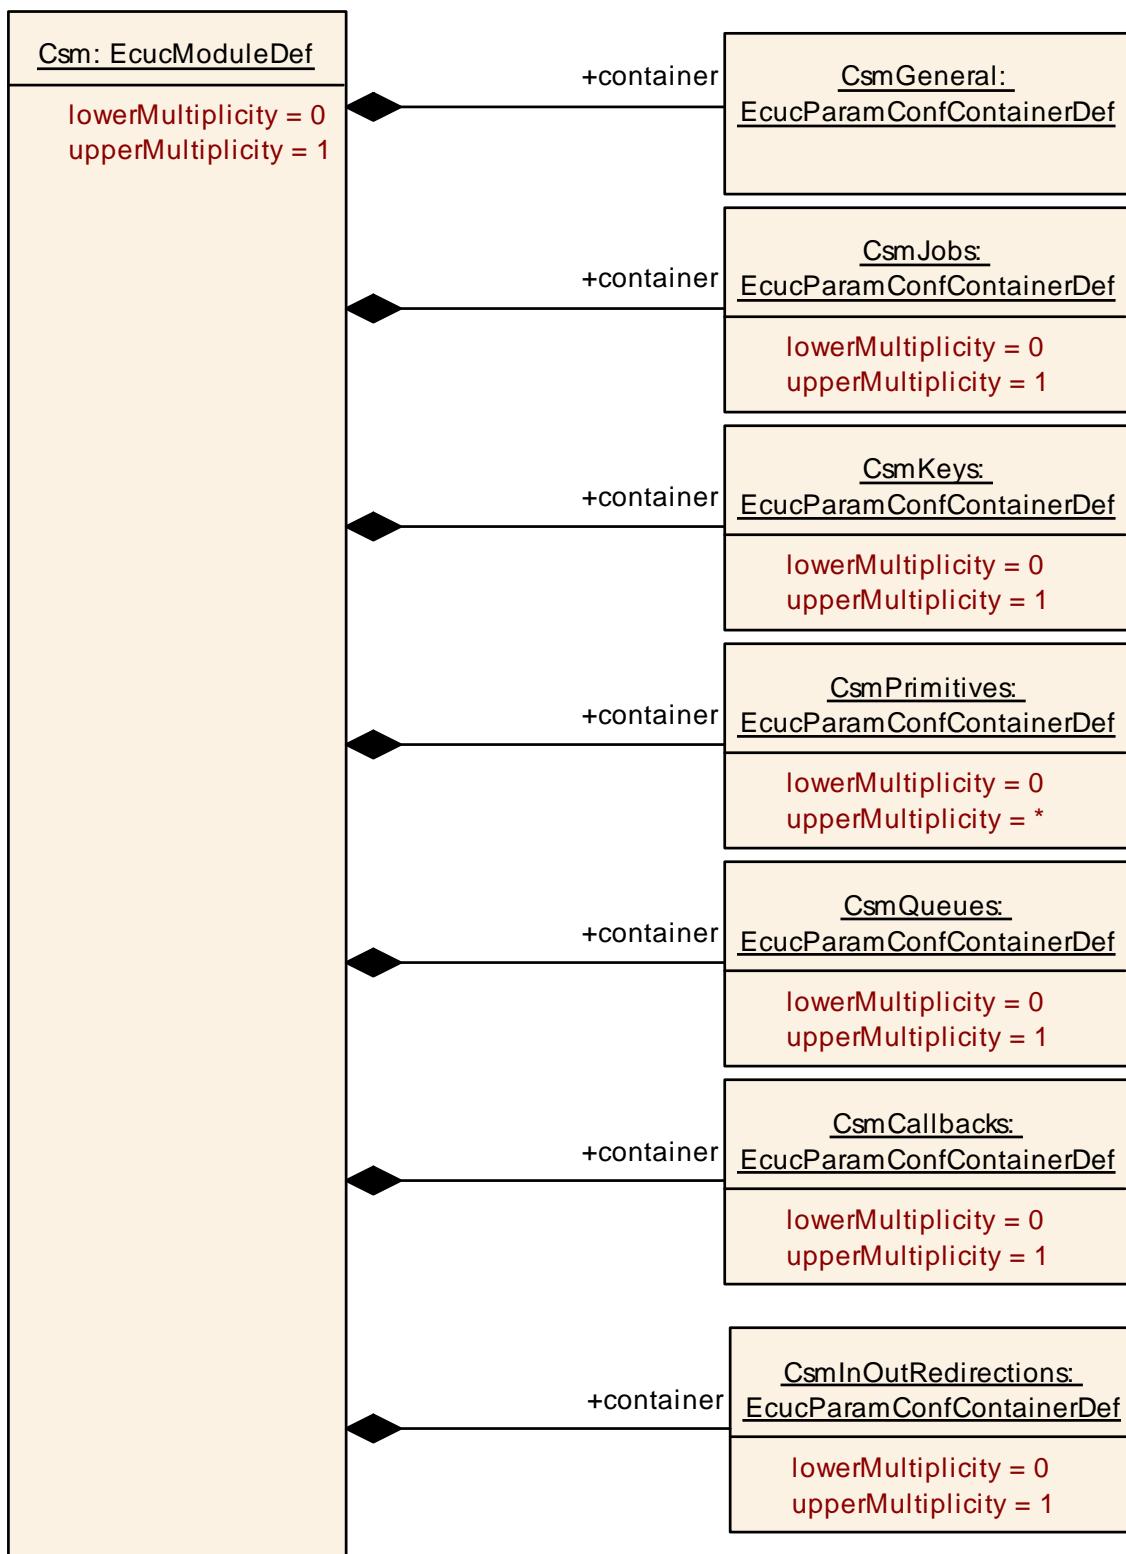

Figure 9-3 Crypto Service Manager Layout

10.2.1 Csm

SWS Item	ECUC_Csm_00818 :
-----------------	-------------------------

Module Name	Csm
Module Description	Configuration of the Csm (CryptoServiceManager) module.
Post-Build Variant Support	false
Supported Config Variants	VARIANT-PRE-COMPIL

Included Containers		
Container Name	Multiplicity	Scope / Dependency
CsmCallbacks	0..1	Container for callback function configurations
CsmGeneral	1	Container for common configuration options.
CsmInOutRedirections	0..1	Configuration for CSM redirection configurations
CsmJobs	0..1	Container for configuration of CSM jobs.
CsmKeys	0..1	Container for CSM key configurations.
CsmMainFunction	0..*	Each element of this container defines one instance of Csm_MainFunction. For each partition, where the Csm module shall be instantiated, at least one MainFunction instance needs to be configured.
CsmPrimitives	0..*	Container for configuration of CsmPrimitives
CsmQueues	0..1	Container for CSM queue configurations

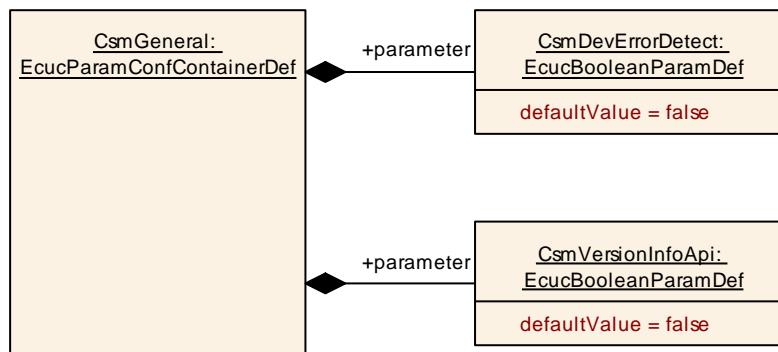

Figure 9-4 Crypto Service Manager General Layout

10.2.2 CsmGeneral

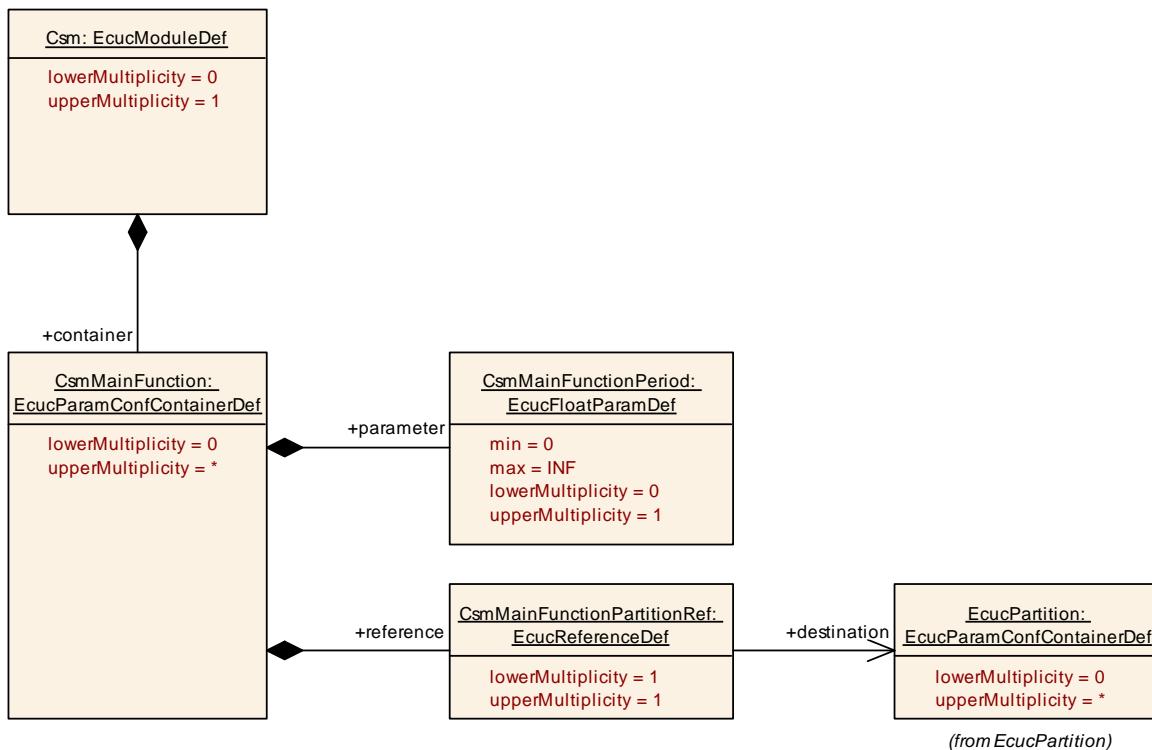

SWS Item	ECUC_Csm_00002 :		
Container Name	CsmGeneral		
Parent Container	Csm		
Description	Container for common configuration options.		
Multiplicity Configuration	Pre-compile time	X	All Variants
Class	Link time	--	
	Post-build time	--	
Configuration Parameters			

SWS Item	ECUC_Csm_00001 :		
Name	CsmDevErrorDetect		
Parent Container	CsmGeneral		
Description	Switches the development error detection and notification on or off. • true: detection and notification is enabled.		

	<ul style="list-style-type: none"> • false: detection and notification is disabled. 		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default value	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	ECUC_Csm_00003 :		
Name	CsmVersionInfoApi		
Parent Container	CsmGeneral		
Description	Pre-processor switch to enable and disable availability of the API Csm_GetVersionInfo(). True: API Csm_GetVersionInfo() is available. False: API Csm_GetVersionInfo() is not available.		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default value	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

No Included Containers

Figure 9-5 Crypto Service Manager MainFunction Layout

10.2.3 CsmMainFunction

SWS Item	ECUC_Csm_00279 :
Container Name	CsmMainFunction
Parent Container	Csm
Description	Each element of this container defines one instance of Csm_MainFunction. For each partition, where the Csm module shall be instantiated, at least one MainFunction instance needs to be configured.
Configuration Parameters	

SWS Item	ECUC_Csm_00113 :		
Name	CsmMainFunctionPeriod		
Parent Container	CsmMainFunction		
Description	Specifies the period of main function Csm_MainFunction in seconds.		
Multiplicity	0..1		
Type	EcucFloatParamDef		
Range]0 .. INF[
Default value	--		
Post-Build Variant	false		
Multiplicity Configuration	Pre-compile time	X	All Variants
Class	Link time	--	
	Post-build time	--	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	

Scope / Dependency	scope: local
---------------------------	--------------

SWS Item	ECUC_Csm_00280 :		
Name	CsmMainFunctionPartitionRef		
Parent Container	CsmMainFunction		
Description	Reference to EcucPartition, where the according CsmMainFunction instance is assigned to.		
Multiplicity	1		
Type	Reference to [EcucPartition]		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

No Included Containers

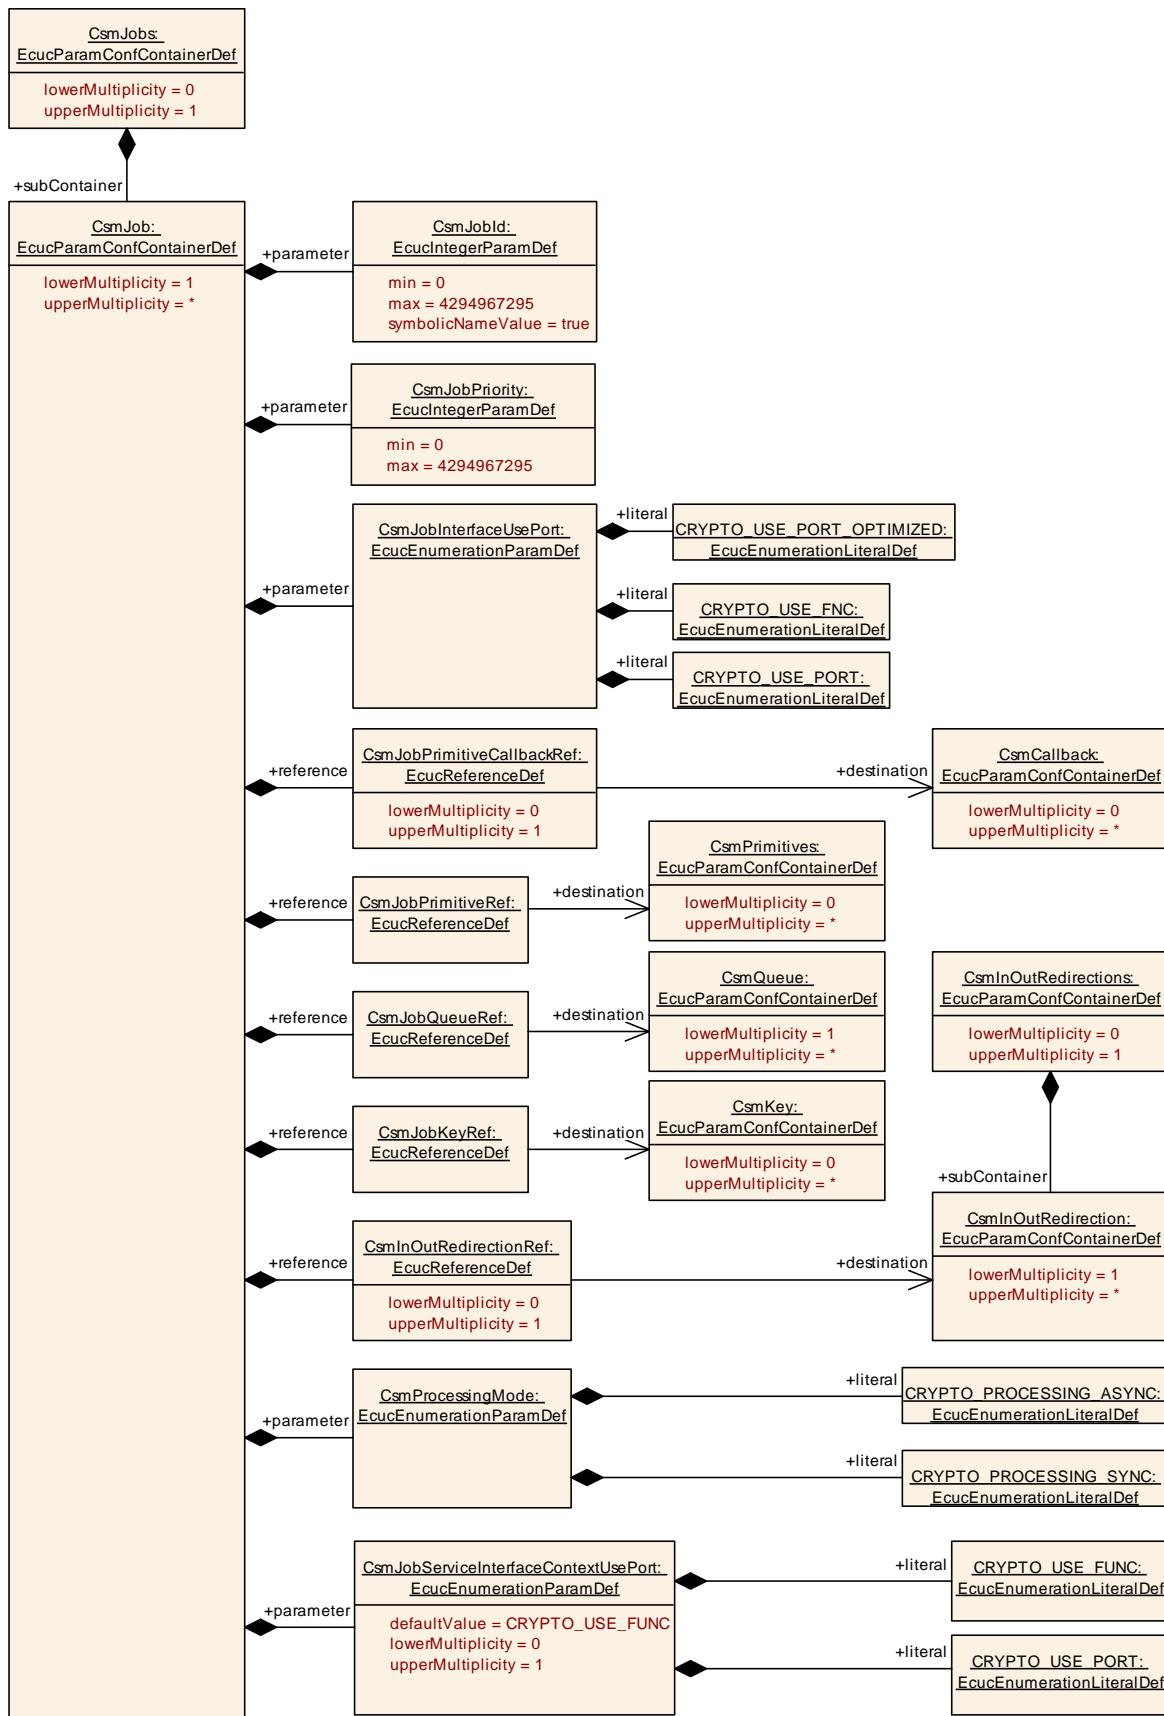

Figure 9-6 CsmJobs Layout

10.2.4 CsmJobs

SWS Item	ECUC_Csm_00112 :		
Container Name	CsmJobs		
Parent Container	Csm		
Description	Container for configuration of CSM jobs.		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Configuration Parameters			

Included Containers			
Container Name	Multiplicity	Scope / Dependency	
CsmJob	1..*	Container for configuration of CSM job. The container name serves as a symbolic name for the identifier of a job configuration.	

10.2.5 CsmJob

SWS Item	ECUC_Csm_00118 :		
Container Name	CsmJob		
Parent Container	CsmJobs		
Description	Container for configuration of CSM job. The container name serves as a symbolic name for the identifier of a job configuration.		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Configuration Parameters			

SWS Item	ECUC_Csm_00119 :		
Name	CsmJobId		
Parent Container	CsmJob		
Description	Identifier of the CSM job. The set of actually configured identifiers shall be consecutive and gapless.		
Multiplicity	1		
Type	EcucIntegerParamDef (Symbolic Name generated for this parameter)		
Range	0 .. 4294967295		
Default value	--		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	ECUC_Csm_00275 :		
Name	CsmJobInterfaceUsePort		
Parent Container	CsmJob		
Description	Does the job need RTE interfaces?		
Multiplicity	1		
Type	EcucEnumerationParamDef		

Range	CRYPTO_USE_FNC	Port is not used.	
	CRYPTO_USE_PORT	Port is used.	
	CRYPTO_USE_PORT_OPTIMIZED	DATA_REFERENCE is used.	
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	ECUC_Csm_00120 :		
Name	CsmJobPriority		
Parent Container	CsmJob		
Description	Priority of the job. The higher the value, the higher the job's priority.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	0 .. 4294967295		
Default value	--		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	ECUC_Csm_00327 :		
Name	CsmJobServiceInterfaceContextUsePort		
Parent Container	CsmJob		
Description	Does the job need RTE interfaces for context operations		
Multiplicity	0..1		
Type	EcucEnumerationParamDef		
Range	CRYPTO_USE_FUNC	Port is not used.	
	CRYPTO_USE_PORT	Port is used for this operation.	
Default value	CRYPTO_USE_FUNC		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	ECUC_Csm_00276 :		
Name	CsmProcessingMode		
Parent Container	CsmJob		
Description	Determines how the interface shall be used for that job. Synchronous processing returns with the result while asynchronous processing returns without processing the job. The caller will be notified by the corresponding callback.		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	CRYPTO_PROCESSING_ASYNC	--	

	CRYPTO_PROCESSING_SYNC	--	
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	ECUC_Csm_00263 :		
Name	CsmlnOutRedirectionRef		
Parent Container	CsmJob		
Description	This parameter refers to the used redirection.		
Multiplicity	0..1		
Type	Reference to [CsmlnOutRedirection]		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	ECUC_Csm_00126 :		
Name	CsmJobKeyRef		
Parent Container	CsmJob		
Description	This parameter refers to the key which shall be used for the CsmPrimitive. It's possible to use a CsmKey for different jobs		
Multiplicity	1		
Type	Reference to [CsmKey]		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local dependency: A dummy key shall be referenced if the CsmPrimitive doesn't require a key (e.g. for Hash calculation).		

SWS Item	ECUC_Csm_00123 :		
Name	CsmJobPrimitiveCallbackRef		
Parent Container	CsmJob		
Description	This parameter refers to the used CsmCallback. The referred CsmCallback is called when the crypto job has been finished.		
Multiplicity	0..1		
Type	Reference to [CsmCallback]		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Value Configuration Class	Pre-compile time	X	All Variants

	<i>Link time</i>	--	
	<i>Post-build time</i>	--	
Scope / Dependency	scope: local		

SWS Item	ECUC_Csm_00122 :		
Name	CsmJobPrimitiveRef		
Parent Container	CsmJob		
Description	This parameter refers to the used CsmPrimitive. Different jobs may refer to one CsmPrimitive. The referred CsmPrimitive provides detailed information on the actual cryptographic routine.		
Multiplicity	1		
Type	Reference to [CsmPrimitives]		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	ECUC_Csm_00125 :		
Name	CsmJobQueueRef		
Parent Container	CsmJob		
Description	This parameter refers to the queue. The queue is used if the underlying crypto driver object is busy. The queue refers also to the channel which is used.		
Multiplicity	1		
Type	Reference to [CsmQueue]		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

No Included Containers

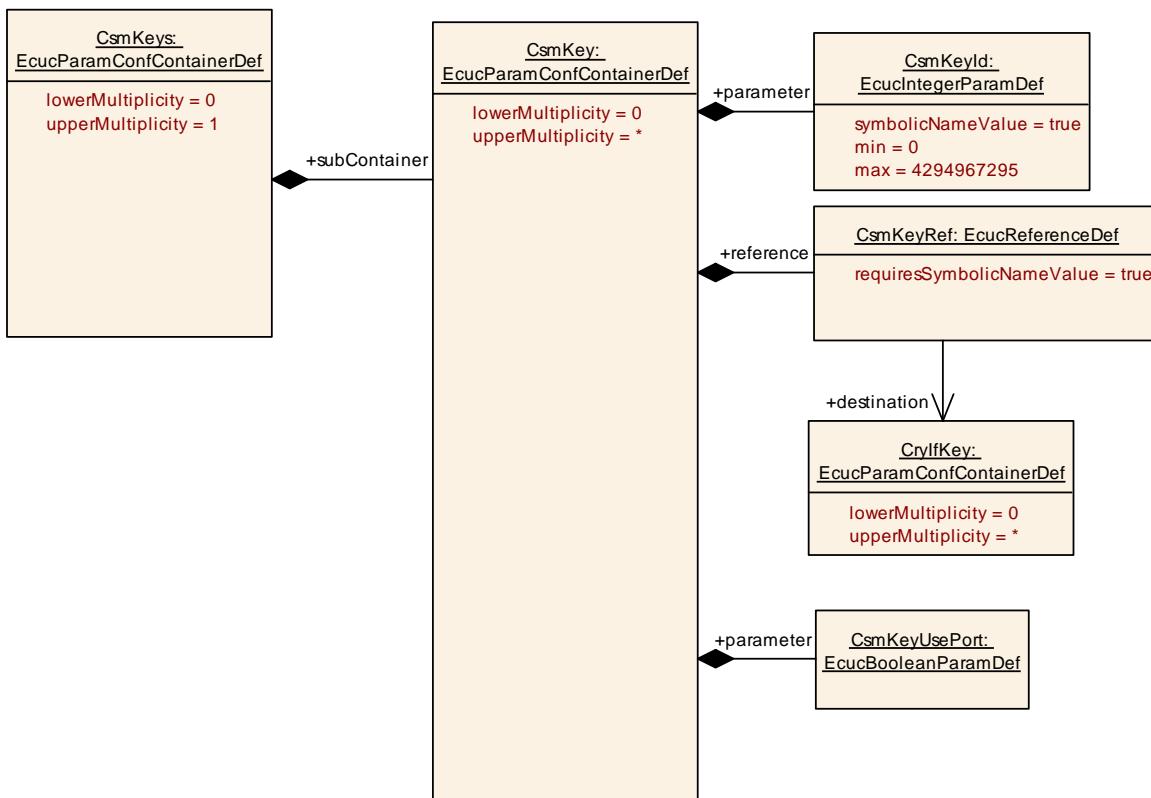

Figure 9-7 Crypto Service Manager Keys Layout

10.2.6 CsmKeys

SWS Item	ECUC_Csm_00005 :	
Container Name	CsmKeys	
Parent Container	Csm	
Description	Container for CSM key configurations.	
Configuration Parameters		

Included Containers		
Container Name	Multiplicity	Scope / Dependency
CsmKey	0..*	Container for configuration of a CSM key. The container name serves as a symbolic name for the identifier of a key configuration.

10.2.7 CsmKey

SWS Item	ECUC_Csm_00014 :	
Container Name	CsmKey	
Parent Container	CsmKeys	
Description	Container for configuration of a CSM key. The container name serves as a symbolic name for the identifier of a key configuration.	
Configuration Parameters		

SWS Item	ECUC_Csm_00015 :	
-----------------	-------------------------	--

Name	CsmKeyId		
Parent Container	CsmKey		
Description	Identifier of the CsmKey. The set of actually configured identifiers shall be consecutive and gapless.		
Multiplicity	1		
Type	EcucIntegerParamDef (Symbolic Name generated for this parameter)		
Range	0 .. 4294967295		
Default value	--		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	ECUC_Csm_00127 :		
Name	CsmKeyUsePort		
Parent Container	CsmKey		
Description	Does the key need RTE interfaces? True: RTE interfaces used for this key False: No RTE interfaces used for this key		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default value	--		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	ECUC_Csm_00016 :		
Name	CsmKeyRef		
Parent Container	CsmKey		
Description	This parameter refers to the used CrylIfKey. The underlying CrylIfKey refers to a specific CryptoKey in the Crypto Driver.		
Multiplicity	1		
Type	Symbolic name reference to [CrylIfKey]		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

No Included Containers

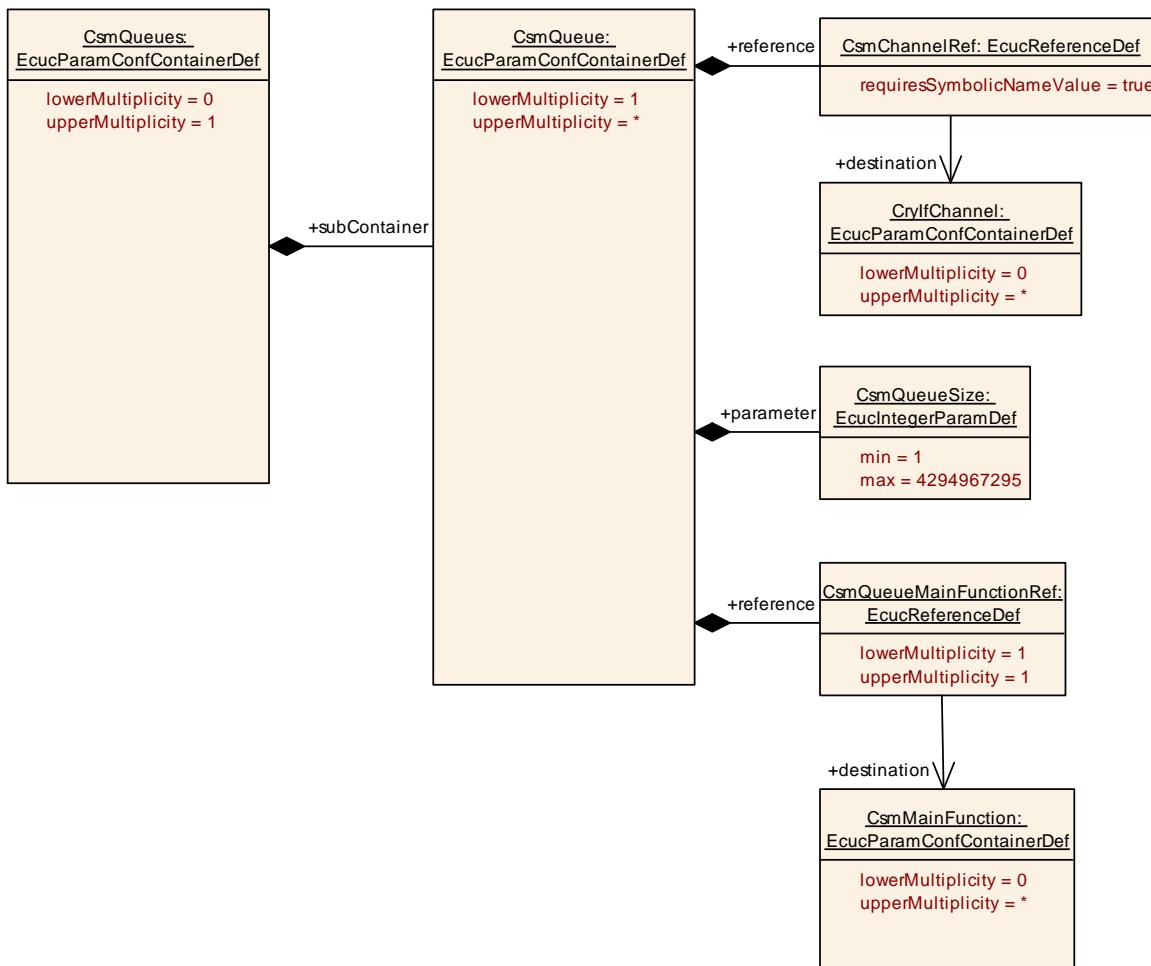

Figure 9-8 Crypto Service Manager Queues Layout

10.2.8 CsmQueues

SWS Item	ECUC_Csm_00007 :
Container Name	CsmQueues
Parent Container	Csm
Description	Container for CSM queue configurations
Configuration Parameters	

Included Containers		
Container Name	Multiplicity	Scope / Dependency
CsmQueue	1..*	Container for configuration of a CSM queue. A queue has two tasks: 1. queue jobs which cannot be processed since the underlying hardware is busy and 2. refer to channel which shall be used

10.2.9 CsmQueue

SWS Item	ECUC_Csm_00032 :
-----------------	------------------

Container Name	CsmQueue
Parent Container	CsmQueues
Description	<p>Container for configuration of a CSM queue.</p> <p>A queue has two tasks:</p> <ol style="list-style-type: none"> 1. queue jobs which cannot be processed since the underlying hardware is busy and 2. refer to channel which shall be used
Configuration Parameters	

SWS Item	ECUC_Csm_00034 :		
Name	CsmQueueSize		
Parent Container	CsmQueue		
Description	Size of the CsmQueue. If jobs cannot be processed by the underlying hardware since the hardware is busy, the jobs stay in the prioritized queue. If the queue is full, the next job will be rejected.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	1 .. 4294967295		
Default value	--		
Post-Build Variant Value	false		
Multiplicity Configuration Class	<i>Pre-compile time</i>	X	All Variants

10.2.12 CsmPrimitives

SWS Item	ECUC_Csm_00006 :		
Container Name	CsmPrimitives		
Parent Container	Csm		
Description	Container for configuration of CsmPrimitives		
Configuration Parameters			

Included Containers

Container Name	Multiplicity	Scope / Dependency
CsmAEADDecrypt	0..1	Configuration of AEAD decryption primitives
CsmAEADEncrypt	0..1	Configuration of AEAD encryption primitives
CsmDecrypt	0..1	Configurations of Decryption primitives
CsmEncrypt	0..1	Configurations of Encryption primitives
CsmHash	0..1	Container for Hash Configurations
CsmJobKeyDerive	0..1	Configurations of KeyDerive primitives
CsmJobKeyExchangeCalcPubVa	0..1	Configurations of KeyExchangeCalcPubVal primitives
CsmJobKeyExchangeCalcSecret	0..1	Configurations of KeyExchangeCalcSecret primitives
CsmJobKeyGenerate	0..1	Configurations of KeyGenerate primitives
CsmJobKeySetInvalid	0..1	Configurations of KeySetInvalid primitives
CsmJobKeySetValid	0..1	Configurations of KeySetValid primitives
CsmJobRandomSeed	0..1	Configurations of RandomSeed primitives
CsmMacGenerate	0..1	Configurations of MacGenerate primitives
CsmMacVerify	0..1	Configurations of MacVerify primitives
CsmRandomGenerate	0..1	Configurations of RandomGenerate primitives
CsmSignatureGenerate	0..1	Configurations of SignatureGenerate primitives
CsmSignatureVerify	0..1	Configurations of SignatureVerify primitives

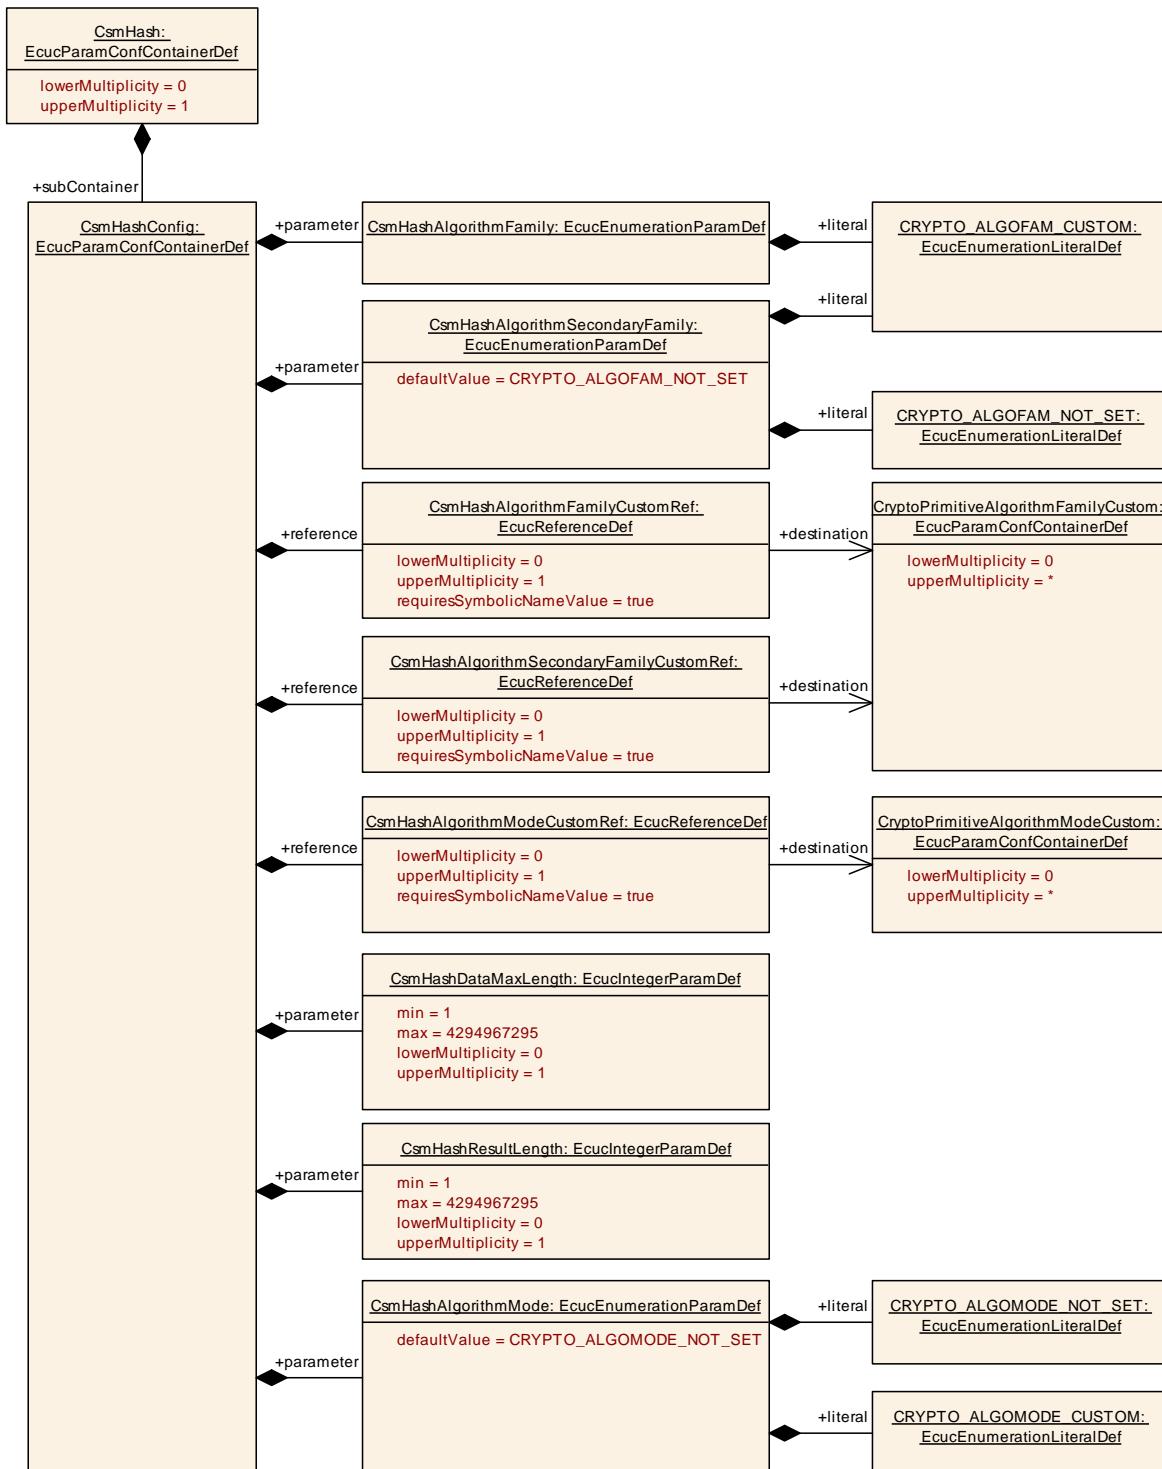

Figure 9-10 CsmHash Layout

SWS Item	ECUC_Csm_00021 :
Container Name	CsmHash
Parent Container	CsmPrimitives
Description	Container for Hash Configurations
Configuration Parameters	

Included Containers		
Container Name	Multiplicity	Scope / Dependency
CsmHashConfig	1	Container for configuration of a CSM hash. The container name serves as a symbolic name for the identifier of a key configuration.

10.2.14 CsmHashConfig

SWS Item	ECUC_Csm_00036 :
Container Name	CsmHashConfig
Parent Container	CsmHash
Description	Container for configuration of a CSM hash. The container name serves as a symbolic name for the identifier of a key configuration.
Configuration Parameters	

SWS Item	ECUC_Csm_00038 :	
Name	CsmHashAlgorithmFamily	
Parent Container	CsmHashConfig	
Description	Determines the algorithm family used for the crypto service. This parameter defines the most significant part of the algorithm.	
Multiplicity	1	
Type	EcucEnumerationParamDef	
Range	CRYPTO_ALGOFAM_BLAKE_1_256 0x0F CRYPTO_ALGOFAM_BLAKE_1_512 0x10 CRYPTO_ALGOFAM_BLAKE_2s_256 0x11 CRYPTO_ALGOFAM_BLAKE_2s_512 0x12 CRYPTO_ALGOFAM_CUSTOM 0xFF CRYPTO_ALGOFAM_RIPEMD160 0x0E CRYPTO_ALGOFAM_SHA1 0x01 CRYPTO_ALGOFAM_SHA2_224 0x02 CRYPTO_ALGOFAM_SHA2_256 0x03 CRYPTO_ALGOFAM_SHA2_384 0x04 CRYPTO_ALGOFAM_SHA2_512 0x05 CRYPTO_ALGOFAM_SHA2_512_224 0x06 CRYPTO_ALGOFAM_SHA2_512_256 0x07 CRYPTO_ALGOFAM_SHA3_224 0x08 CRYPTO_ALGOFAM_SHA3_256 0x09 CRYPTO_ALGOFAM_SHA3_384 0x0A CRYPTO_ALGOFAM_SHA3_512 0x0B CRYPTO_ALGOFAM_SHAKE128 0x0C CRYPTO_ALGOFAM_SHAKE256 0x0D CRYPTO_ALGOFAM_SM3 0x29	
Post-Build Variant Value	false	
Multiplicity Configuration Class	Pre-compile time	X All Variants
	Link time	--
	Post-build time	--
Value Configuration Class	Pre-compile time	X All Variants
	Link time	--
	Post-build time	--
Scope / Dependency	scope: local	

SWS Item	ECUC_Csm_00131 :		
Name	CsmHashAlgorithmMode		
Parent Container	CsmHashConfig		
Description	Determines the algorithm mode used for the crypto service		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	CRYPTO_ALGOMODE_CUSTOM	0xFF	
	CRYPTO_ALGOMODE_NOT_SET	0x00	
Default value	CRYPTO_ALGOMODE_NOT_SET		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	ECUC_Csm_00181 :		
Name	CsmHashAlgorithmSecondaryFamily		
Parent Container	CsmHashConfig		
Description	Determines the algorithm family used for the crypto service		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	CRYPTO_ALGOFAM_CUSTOM	0xFF	
	CRYPTO_ALGOFAM_NOT_SET	0x00	
Default value	CRYPTO_ALGOFAM_NOT_SET		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	ECUC_Csm_00040 :		
Name	CsmHashDataMaxLength		
Parent Container	CsmHashConfig		
Description	Size of the input data buffer for the synchronous RTE service interface if this primitive is referenced by a Csm job. It may also be possible that other BSW modules use the length parameter for buffer size calculation.		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	1 .. 4294967295		
Default value	--		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Value Configuration Class	Pre-compile time	X	All Variants

	<i>Link time</i>	--	
	<i>Post-build time</i>	--	
Scope / Dependency	scope: local dependency: This parameter is only relevant if CsmJobInterfaceUsePort is configured as CRYPTO_USE_PORT.		

SWS Item	ECUC_Csm_00130 :		
Name	CsmHashResultLength		
Parent Container	CsmHashConfig		
Description	Size of the result data buffer for the synchronous RTE service interface if this primitive is referenced by a Csm job. It may also be possible that other BSW modules use the length parameter for buffer size calculation.		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	1 .. 4294967295		
Default value	--		
Post-Build Variant Value	false		
Multiplicity Configuration Class	<i>Pre-compile time</i>	X	All Variants
	<i>Link time</i>	--	
	<i>Post-build time</i>	--	
Value Configuration Class	<i>Pre-compile time</i>	X	All Variants
	<i>Link time</i>	--	
	<i>Post-build time</i>	--	
Scope / Dependency	scope: local dependency: This parameter is only relevant if CsmJobInterfaceUsePort is configured as CRYPTO_USE_PORT.		

SWS Item	ECUC_Csm_00282 :		
Name	CsmHashAlgorithmFamilyCustomRef		
Parent Container	CsmHashConfig		
Description	Reference to a customer specific algorithm family custom container		
Multiplicity	0..1		
Type	Symbolic name reference to [CryptoPrimitiveAlgorithmFamilyCustom]		
Multiplicity Configuration Class	<i>Pre-compile time</i>	X	All Variants
	<i>Link time</i>	--	
	<i>Post-build time</i>	--	
Value Configuration Class	<i>Pre-compile time</i>	X	All Variants
	<i>Link time</i>	--	
	<i>Post-build time</i>	--	
Scope / Dependency	scope: local dependency: This parameter shall only be present if CsmHashAlgorithmFamily is set to CRYPTO_ALGOFAM_CUSTOM.		

SWS Item	ECUC_Csm_00284 :		
Name	CsmHashAlgorithmModeCustomRef		
Parent Container	CsmHashConfig		
Description	Reference to a customer specific algorithm mode custom container		
Multiplicity	0..1		
Type	Symbolic name reference to [CryptoPrimitiveAlgorithmModeCustom]		
Multiplicity Configuration Class	<i>Pre-compile time</i>	X	All Variants
	<i>Link time</i>	--	
	<i>Post-build time</i>	--	
Value Configuration Class	<i>Pre-compile time</i>	X	All Variants
	<i>Link time</i>	--	
	<i>Post-build time</i>	--	

Scope / Dependency	scope: local dependency: This reference shall only be present if CsmHashAlgorithmMode is set to CRYPTO_ALGOMODE_CUSTOM.
---------------------------	--

SWS Item	ECUC_Csm_00283 :		
Name	CsmHashAlgorithmSecondaryFamilyCustomRef		
Parent Container	CsmHashConfig		
Description	Reference to a customer specific algorithm family container in the Crypto Driver		
Multiplicity	0..1		
Type	Symbolic name reference to [CryptoPrimitiveAlgorithmFamilyCustom]		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local dependency: This reference shall only be present if CsmHashSecondaryAlgorithmFamily is set to CRYPTO_ALGOFAM_CUSTOM.		

No Included Containers

10.2.15 CsmMacGenerate

SWS Item	ECUC_Csm_00022 :
Container Name	CsmMacGenerate
Parent Container	CsmPrimitives
Description	Configurations of MacGenerate primitives

Configuration Parameters
Included Containers

Container Name	Multiplicity	Scope / Dependency
CsmMacGenerateConfig	1	Container for configuration of a CSM mac generation interface. The container name serves as a symbolic name for the identifier of a MAC generation interface.

10.2.16 CsmMacGenerateConfig

SWS Item	ECUC_Csm_00041 :
Container Name	CsmMacGenerateConfig
Parent Container	CsmMacGenerate
Description	Container for configuration of a CSM mac generation interface. The container name serves as a symbolic name for the identifier of a MAC generation interface.

Configuration Parameters

SWS Item	ECUC_Csm_00188 :	
Name	CsmMacGenerateAlgorithmFamily	
Parent Container	CsmMacGenerateConfig	
Description	Determines the algorithm family used for the crypto service. This parameter defines the most significant part of the algorithm.	
Multiplicity	1	
Type	EcucEnumerationParamDef	
Range	CRYPTO_ALGOFAM_3DES	0x13
	CRYPTO_ALGOFAM_AES	0x14

Container Name	CsmAEADDecryptConfig	
Parent Container	CsmAEADDecrypt	
Description	Container for configuration of a CSM decryption interface. The container name serves as a symbolic name for the identifier of an decryption interface.	
Configuration Parameters		

SWS Item	ECUC_Csm_00082 :	
Name	CsmAEADDecryptAlgorithmFamily	
Parent Container	CsmAEADDecryptConfig	
Description	Determines the algorithm family used for the crypto service. This parameter defines the most significant part of the algorithm. See diagram CsmAEADDecryptAlgorithmFamily	
Multiplicity	1	
Type	EcucEnumerationParamDef	
Range	CRYPTO_ALGOFAM_3DES	0x13
	CRYPTO_ALGOFAM_AES	0x14
	CRYPTO_ALGOFAM_CHACHA	0x15
	CRYPTO_ALGOFAM_CUSTOM	0xFF
	CRYPTO_ALGOFAM_EEA3	0x28
Post-Build Variant Value	false	
Multiplicity Configuration Class	Pre-compile time	X All Variants
	Link time	--
	Post-build time	--
Value Configuration Class	Pre-compile time	X All Variants
	Link time	--
	Post-build time	--
Scope / Dependency	scope: local	

SWS Item	ECUC_Csm_00083 :	
Name	CsmAEADDecryptAlgorithmKeyLength	

Parent Container	CsmAEADDecryptConfig		
Description	Size of the AEAD decryption key in bytes		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	1 .. 4294967295		
Default value	--		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	ECUC_Csm_00084 :		
Name	CsmAEADDecryptAlgorithmMode		
Parent Container	CsmAEADDecryptConfig		
Description	Determines the algorithm mode used for the crypto service See diagram CsmAEADDecryptAlgorithmMode		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	CRYPTO_ALGOMODE_12ROUNDS	0x0d	
	CRYPTO_ALGOMODE_20ROUNDS	0x0e	
	CRYPTO_ALGOMODE_8ROUNDS	0x0c	
	CRYPTO_ALGOMODE_CUSTOM	0xFF	
	CRYPTO_ALGOMODE_GCM	0x07	
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	ECUC_Csm_00277 :		
Name	CsmAEADDecryptAlgorithmSecondaryFamily		
Parent Container	CsmAEADDecryptConfig		
Description	Defines the secondary family used for the crypto service		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	CRYPTO_ALGOFAM_CUSTOM	0xFF	
	CRYPTO_ALGOFAM_NOT_SET	0x00	
	CRYPTO_ALGOFAM_POLY1305	0x2D	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	ECUC_Csm_00163 :		
Name	CsmAEADDecryptAssociatedDataMaxLength		
Parent Container	CsmAEADDecryptConfig		

Description	Size of the input associated data buffer for the synchronous RTE service interface if this primitive is referenced by a Csm job. It may also be possible that other BSW modules use the length parameter for buffer size calculation.		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	1 .. 4294967295		
Default value	--		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local dependency: This parameter is only relevant if CsmJobInterfaceUsePort is configured as CRYPTO_USE_PORT.		

SWS Item	ECUC_Csm_00162 :		
Name	CsmAEADDcryptCiphertextMaxLength		
Parent Container	CsmAEADDcryptConfig		
Description	Size of the input ciphertext buffer for the synchronous RTE service interface if this primitive is referenced by a Csm job. It may also be possible that other BSW modules use the length parameter for buffer size calculation.		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	1 .. 4294967295		
Default value	--		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local dependency: This parameter is only relevant if CsmJobInterfaceUsePort is configured as CRYPTO_USE_PORT		

SWS Item	ECUC_Csm_00165 :		
Name	CsmAEADDcryptPlaintextMaxLength		
Parent Container	CsmAEADDcryptConfig		
Description	Size of the output plaintext length buffer for the synchronous RTE service interface if this primitive is referenced by a Csm job. It may also be possible that other BSW modules use the length parameter for buffer size calculation.		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	1 .. 4294967295		
Default value	--		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	

Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local dependency: This parameter is only relevant if CsmJobInterfaceUsePort is configured as CRYPTO_USE_PORT.		

SWS Item	ECUC_Csm_00164 :		
Name	CsmAEADDecryptTagLength		
Parent Container	CsmAEADDecryptConfig		
Description	Size of the input tag buffer in BITS for the synchronous RTE service interface if this primitive is referenced by a Csm job. It may also be possible that other BSW modules use the length parameter for buffer size calculation."		
Multiplicity	0..1		
Type	EcucIntegerParamDef		
Range	1 .. 4294967295		
Default value	--		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local dependency: This parameter is only relevant if CsmJobInterfaceUsePort is configured as CRYPTO_USE_PORT.		

SWS Item	ECUC_Csm_00300 :		
Name	CsmAEADDecryptAlgorithmFamilyCustomRef		
Parent Container	CsmAEADDecryptConfig		
Description	Reference to a customer specific algorithm family custom container		
Multiplicity	0..1		
Type	Symbolic name reference to [CryptoPrimitiveAlgorithmFamilyCustom]		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local dependency: This reference shall only be present if CsmAEADDecryptAlgorithmFamily is set to CRYPTO_ALGOFAM_CUSTOM.		

SWS Item	ECUC_Csm_00301 :		
Name	CsmAEADDecryptAlgorithmModeCustomRef		
Parent Container	CsmAEADDecryptConfig		
Description	Reference to a customer specific algorithm mode custom container		
Multiplicity	0..1		
Type	Symbolic name reference to [CryptoPrimitiveAlgorithmModeCustom]		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	--	
	Post-build time	--	
Value Configuration Class	Pre-compile time	X	All Variants

	<i>Link time</i>	--	
	<i>Post-build time</i>	--	
Scope / Dependency	scope: local dependency: This reference shall only be present if CsmAEADDecryptAlgorithmMode is set to CRYPTO_ALGOMODE_CUSTOM.		

SWS Item	ECUC_Csm_00302 :		
Name	CsmAEADDecryptAlgorithmSecondaryFamilyCustomRef		
Parent Container	CsmAEADDecryptConfig		
Description	Reference to a customer specific algorithm family container in the Crypto Driver		
Multiplicity	0..1		
Type	Symbolic name reference to [CryptoPrimitiveAlgorithmFamilyCustom]		
Multiplicity Configuration Class	<i>Pre-compile time</i>	X	All Variants
	<i>Link time</i>	--	
	<i>Post-build time</i>	--	
Value Configuration Class	<i>Pre-compile time</i>	X	All Variants
	<i>Link time</i>	--	
	<i>Post-build time</i>	--	
Scope / Dependency	scope: local dependency: This reference shall only be present if CsmAEADDecryptSecondaryAlgorithmFamily is set to CRYPTO_ALGOFAM_CUSTOM.		

SWS Item	ECUC_Csm_00086 :		
Name	CsmAEADDecryptKeyRef		
Parent Container	CsmAEADDecryptConfig		
Description	This parameter refers to the key used for that decryption primitive.		
Multiplicity	1		
Type	Reference to [CsmKey]		
Post-Build Variant Value	false		
Multiplicity Configuration Class	<i>Pre-compile time</i>	X	All Variants
	<i>Link time</i>	--	
	<i>Post-build time</i>	--	
Value Configuration Class	<i>Pre-compile time</i>	X	All Variants
	<i>Link time</i>	--	
	<i>Post-build time</i>	--	
Scope / Dependency	scope: local		

SWS Item	ECUC_Csm_00081 :		
Name	CsmAEADDecryptQueueRef		
Parent Container	CsmAEADDecryptConfig		
Description	This parameter refers to the queue used for that decryption primitive.		
Multiplicity	1		
Type	Reference to [CsmQueue]		
Post-Build Variant Value	false		
Multiplicity Configuration Class	<i>Pre-compile time</i>	X	All Variants
	<i>Link time</i>	--	
	<i>Post-build time</i>	--	
Value Configuration Class	<i>Pre-compile time</i>	X	All Variants
	<i>Link time</i>	--	
	<i>Post-build time</i>	--	
Scope / Dependency	scope: local		

No Included Containers

10.2.31 CsmRandomGenerate

SWS Item	ECUC_Csm_00031 :	
Container Name	CsmRandomGenerate	
Parent Container	CsmPrimitives	
Description	Configurations of RandomGenerate primitives	
Configuration Parameters		

Included Containers		
Container Name	Multiplicity	Scope / Dependency
CsmRandomGenerateConfig	1	Container for configuration of a CSM random generator. The container name serves as a symbolic name for the identifier of a random generator configuration.

10.2.32 CsmRandomGenerateConfig

SWS Item	ECUC_Csm_00103 :	
Container Name	CsmRandomGenerateConfig	
Parent Container	CsmRandomGenerate	
Description	Container for configuration of a CSM random generator. The container name serves as a symbolic name for the identifier of a random generator configuration.	
Configuration Parameters		

SWS Item	ECUC_Csm_00105 :	
Name	CsmRandomGenerateAlgorithmFamily	
Parent Container	CsmRandomGenerateConfig	
Description	Determines the algorithm family used for the crypto service. This parameter defines the most significant part of the algorithm.	
Multiplicity	1	
Type	EcucEnumerationParamDef	
Range	CRYPTO_ALGOFAM_3DES	0x13
	CRYPTO_ALGOFAM_AES	0x14
	CRYPTO_ALGOFAM_BLAKE_1_256	0x0F
	CRYPTO_ALGOFAM_BLAKE_1_512	0x10
	CRYPTO_ALGOFAM_BLAKE_2s_256	0x11
	CRYPTO_ALGOFAM_BLAKE_2s_512	0x12
	CRYPTO_ALGOFAM_CHACHA	0x15
	CRYPTO_ALGOFAM_CUSTOM	0xFF
	CRYPTO_ALGOFAM_EEA3	0x28
	CRYPTO_ALGOFAM_RIPEMD160	0x0E
	CRYPTO_ALGOFAM_RNG	0x1B
	CRYPTO_ALGOFAM_SHA1	0x01
	CRYPTO_ALGOFAM_SHA2_224	0x02
	CRYPTO_ALGOFAM_SHA2_256	0x03
	CRYPTO_ALGOFAM_SHA2_384	0x04
	CRYPTO_ALGOFAM_SHA2_512	0x05
	CRYPTO_ALGOFAM_SHA2_512_224	0x06
	CRYPTO_ALGOFAM_SHA2_512_256	0x07
	CRYPTO_ALGOFAM_SHA3_224	0x08
	CRYPTO_ALGOFAM_SHA3_256	0x09
	CRYPTO_ALGOFAM_SHA3_384	0x0A
	CRYPTO_ALGOFAM_SHA3_512	0x0B

	CRYPTO_ALGOFAM_SHAKE128	0x0C	
	CRYPTO_ALGOFAM_SHAKE256	0x0D	
	CRYPTO_ALGOFAM_SM3	0x29

10.2.33 CsmJobKeySetValid

SWS Item	ECUC_Csm_00196 :
Container Name	CsmJobKeySetValid
Parent Container	CsmPrimitives
Description	Configurations of KeySetValid primitives
Configuration Parameters	

Included Containers	Multiplicity	Scope / Dependency
Container Name		

CsmJobKeySetValidConfig	1	Container for configuration of a CSM key set valid operation. The container name serves as a symbolic name for the identifier of a key configuration.
-------------------------	---	---

10.2.34 CsmJobKeySetValidConfig

SWS Item	ECUC_Csm_00204 :	
Container Name	CsmJobKeySetValidConfig	
Parent Container	CsmJobKeySetValid	
Description	Container for configuration of a CSM key set valid operation. The container name serves as a symbolic name for the identifier of a key configuration.	
Configuration Parameters		

SWS Item	ECUC_Csm_00328 :	
Name	CsmJobKeySetValidAlgorithmFamily	
Parent Container	CsmJobKeySetValidConfig	
Description	Determines the algorithm family used for the crypto service. This parameter defines the most significant part of the algorithm.	
Multiplicity	1	
Type	EcucEnumerationParamDef	
Range	CRYPTO_ALGOFAM_CUSTOM	0xFF
	CRYPTO_ALGOFAM_NOT_SET	0x00
